INDIAN MEDICAL SERVICE

Recruitment of European Officers.

Applications are invited from medical men for permanent commissions in H M's Indian Medical Service The terms offered include a gratuity of £1,000 on retirement after six years' service, or £2,500 after 12 years' service, together with free return passages, for those who no longer desire to remain in the Service In other respects the terms will be as detailed below

Candidates must be British subjects under 32 years of age at the time of application and must be registered under the Medical Acts in force in Great Britain and Northern Ireland

CAREERS

The Indian Medical Service offers wide opportunities of medical experience, including clinical preventive, specialist, and research work At the beginning of his career an officer is employed on the military side, which has medical charge of the Indian Army Promotion is on a time scale up to the rank of Lieutenant-Colonel, and by selection to the ranks of Colonel and Major-General An officer may apply after two years Indian service to have his name registered for transfer to the civil side, from which appointments are made to Civil Surgeoncies, which are established at the principal civil centres to provide for the medical needs of civil officials and for general medical administrative purposes, to specialist (for example, public health and bacteriological) services, to research posts, and to professorships at the Medical Schools

PAY

The monthly rates of pay for European officers in the Service who have a "non-Asiatic" domicile are as follows

Rank	Service in Rank	Basic Pay	Overseas Pay	Year of Total Service
1	2	3	4	5
		Rs	Rs	
		500	150	1st
Lieut			150	2nd
			1 0	3rd
Capt	(i) During first 3 years service as Captain	650	150	4th
			£15	5th
			£15	6th
	(ii) With more than 3 and less than 6 yrs service as Captain	750	£20	7th
			£20	8th
			£20	9th
	(iii) With more than 6 years service as Captain	850	£20	10th
			£20	11th
			£30	12th
Major	(i) During first 3 years service as Major	950		
	(ii) With more than 3 and less than 6 years service as Major	1100		
	(iii) With more than 6 years service as Major	1250		
Lieut Col	(i) Until completion of 23 years total service	1500	£30	13th and over
	(ii) During 24th and 25th years service	1600		
	(iii) After completion of 25 years total service	1700		
	(iv) When selected for increased pay	1850		

EXTRAS —In addition to the above rates various allowances are admissible for a large number of special appointments on both the military and the civil side which may be held by members of the Indian Medical Service Special high rates of pay are also attached to the numerous administrative appointments open to officers in both branches of the Service

ANTEDATES IN COMMISSION

Any service rendered by an officer during the war as a medical or combatant officer, or in a position usually filled by an officer may be counted as service for increments of pay promotion retirement and retired pay, but not for gratuity

One half of any service in the ranks during the war may be counted as service for retirement and retired pay only

Candidates possessing certain higher medical qualifications may be granted an antedate of one year in their commissions Past service in certain hospital appointments may also render candidates eligible for an antedate of one year Persons holding or about to hold resident posts at recognized hospitals may be seconded in those posts for a period not exceeding one year The maximum period of antedate, secondment or antedate and secondment combined admissible under this paragraph, is limited to one year

OUTFIT ALLOWANCE

Officers on appointment will receive an outfit allowance of £50

PRIVATE PRACTICE

With the exception of Administrative Officers, military or civil, and officers holding certain special appointments, officers are not debarred from taking private practice, so long as it does not interfere with their proper duties

PENSIONS

The rates of pension are as follows	Per annum
	£
After 17 years service for pension	400
,, 18 ,, ,, ,,	430
,, 19 ,, ,, ,,	460
,, 20 ,, ,, ,,	500
,, 21 ,, ,, ,,	540
,, 22 ,, ,, ,,	580
,, 23 ,, ,, ,,	620
,, 24 ,, ,, ,,	660
,, 25 ,, ,, ,,	700
,, 26 ,, ,, ,,	750
,, 27 ,, ,, ,,	800

These rates are subject to alteration on account of a rise or fall in the cost of living as compared with the year 1919 to an extent not exceeding 20 per cent in all, the revision being undertaken triennially With effect from July 1st, 1927, a reduction of 4½ per cent has been made on this account from the amounts shown

There are additional pensions ranging from £65 to £350 per annum for officers who have held administrative appointments

PASSAGES

An officer on appointment is provided with a free passage to India The wives and families of officers who are married prior to the date of the officers embarkation on first appointment will also be provided with free passage to India, subject to the payment of messing charges

Officers and their families are also eligible for passage concessions under which they are granted a certain number of return passages home at Government expense during their service

INSTRUCTION PRIOR TO EMBARKATION

Officers are required to undergo courses of instruction at the Royal Army Medical College and at Aldershot lasting approximately six months, prior to their embarkation for India on first appointment

Full details regarding these appointments and forms of application may be obtained from the Under-Secretary of State for India, Military Department, India Office, London, S W 1 The Selection Committee will meet at the India Office in July, and the selected candidates will be required to join a course of instruction commencing early in August, 1930 Applications should be submitted as soon as possible

WEST AFRICAN MEDICAL STAFF.

Vacancies at present exist for MEDICAL OFFICERS in the WEST AFRICAN MEDICAL STAFF

Qualifications Candidates must be British subjects of European parentage and under 35 years of age. They must possess a double qualification and be on the British Medical Register Preference will be given to candidates who have held Hospital or Public Health appointments, or who have special knowledge of anæsthetics, radiology, surgery, medicine, ophthalmology, gynæcology and midwifery, diseases of the ear, nose, and throat, venereal diseases, etc

Salary £660 per annum, rising by annual increments of £30 per annum to £720 per annum, and then, on confirmation, £720 per annum, rising by annual increments of £40 to £960 per annum, together with a seniority allowance (payable only in West Africa) at the rate of £72 per annum After three years service on £960, the salary may be raised to the scale of £1,000 per annum, rising by annual increments of £50 to £1,150 per annum, together with a seniority allowance at the rate of £100 per annum

Quarters Free quarters are provided or an allowance is given in lieu

Outfit Allowance An outfit allowance of £60 is granted on first appointment

Passages Free first-class passages are provided for the officer only both on first appointment and when proceeding on or returning from leave A married officer will, in certain circumstances, be granted half the cost of his wife's passages to and from West Africa

Terms of Appointment The appointments are pensionable, subject to a probationary period of three years in the first instance

Tour of Service The normal tour of service in West Africa is approximately 18 months, though vacation leave may be granted by the Governor after 12 months, and is followed by leave at the rate of one week for each completed month of residential service, plus the time necessarily spent in the voyages to and from England

Course of Instruction in Tropical Medicine Selected candidates will normally be required to attend a course of instruction in Tropical Medicine and Hygiene before proceeding overseas

Duties Though Medical Officers are appointed in the first instance for general service, there are good opportunities for work in special branches of medicine and surgery and for research

Further particulars and forms of application may be obtained on application in writing from the Private Secretary (Appointments) Colonial Office 2 Richmond Terrace Whitehall London S W 1

CREMOR ALKALINUS 'A. & H.'

For the Intensive Alkaline Treatment of Gastric and Duodenal Ulcers.

For the convenience of practitioners the following approved formulæ are prepared in the form of simple creams which are exceptionally free from grittiness and convenient and pleasant to use

Cremor Alkalinus 'A & H'

Formula A

Sod Bicarb	2 parts
Mag Carb	4 parts
Calcium Carb	4 parts
Bismuth Carb	1 part

This is the standard preparation

Cremor Alkalinus 'A & H'

Formula B

Sod Bicarb	2 parts
Mag Carb	3 parts
Calcium Carb	4 parts
Bismuth Carb	2 parts

This is employed in cases where Formula A proves too laxative

Cremor Alkalinus 'A & H'

Formula C

Sod Bicarb	3 parts
Mag Carb	8 parts
Calcium Carb	12 parts

Specially suitable for cases in which a bismuth free preparation is desired

Cremor Alkalinus 'A & H'

Formula K

Sod Bicarb	2 parts
Mag Carb	3 parts
Calcium Carb	4 parts
'Osmo' Kaolin	2 parts

The bismuth is replaced by colloidal kaolin which possesses marked toxin-adsorbing properties

In 8 oz bottles for prescribing
In 80 oz bottles for dispensing

Taka-Diastase

FOR AMYLACEOUS DYSPEPSIA

PARKE DAVIS & Co introduced Taka-Diastase to the medical profession more than a third of a century ago and it was not long before it came to be recognised as the standard remedy for so called amylaceous dyspepsia

Without question, Taka Diastase is the most powerful of all amylolytic agents of vegetable origin. It is standardised to render soluble three hundred times its weight of dry starch in ten minutes the starch being transformed to dextrins maltose and dextrose

Taka-Diastase is also an active proteolytic and further acts in neutral, slightly alkaline or slightly acid media Whilst a very active therapeutic agent Taka-Diastase is perfectly harmless Being tasteless it is freely taken by all patients

Supplied as powder tablets or liquid Tablets are also available containing Taka Diastase with pepsin pancreatin or strychnine It may also be obtained as an elixir with bismuth nux vomica and hydrocyanic acid Further particulars will be sent on request

EXCERPT FROM WRITINGS OF THE BYZANTINE GREEK PHYSICIAN, ALEXANDER OF TRALLES —Alexander's work influenced the development of medicine and bears evidence of a truly pioneer spirit in an age of mental stagnation and slavish acceptance of authority His medical writings are based upon Galen, whom he always calls "most divine Nevertheless he supplements and even criticises the treatment prescribed by this high authority when his own wide practical experience forces him to differ In the extract here reproduced he differs from Galen, who in certain cases prescribed 'drying' and 'heating" medicines, such as mithridate theriaca, etc even while he admitted that all the patients thus treated had died Remaining adamant in his opinion Alexander thus apologises for contradicting his master 'Herein is illustrated the truth of the word once spoken by Galen himself of Archigenes, 'He was a man and it is therefore difficult to assume that he never erred

μέμνηται δε και ο θειοτατος Γαληνος ου λιθου ανατμητικου τινος, αλλα γαλαζιου, παραλησια και αλλων τινων αναπτυσσοντων εσπιστα γαρ τη χροα και θερμαζω, πως αυτος ουκ ειπ των εμπυγοντων ηδυνηθη χρησασθαι, αλλα τουτοις μεν εχρησατο μαλλον τη θερμαντικη χυμωτη — τουτο γαρ — Μοσχιωνειος αυτοις παρειχον, ως αυτος — και την αθυμιαν και την επι μαλλον ξηραινειν — συναμενην θηριακην — και πασαις ταις αλλαις απιδιοτοις ταις προ του, ασθματικους αναγεγραμμεναις δια θριμεων τινων και επισπαστων συγκειμεναις φαρμακων ου μονον εφ ενος, ανδρος, αλλα και επι πλειστων εωρακεναι αυτα φησιν ουδενα δε ξυνηθουντα — των τοιουτων παθων, — εκφυγειν τον θανατον, αλλα παντα, απ εσθοι ολιγω πλειονα χρονον η ελαττονα διαρκεσαι ξυνηθεντας αλλ ουτω, αληθες, εστιν εκεινο το λεγθεν υπο αυτου Αρχιγενους, 'ανηρ ην γαρ ανθρωπος και ουτω μη και διαμαρτανειν εν πολλοις, τα μεν ειλως αρτησαντα, τα δε καλως τριψαντα

Beckman's Treatment

The successful therapeutic methods of many physicians and of many years of practice have been worked into the background of this unusual book on treatment

No efficacious method is overlooked or lightly treated Prescriptions are written out in full Diet lists are given in simple terms

The entire care of a case is outlined, every step to meet every need Dr Beckman gives you a guide—a complete guide—to treatment

With the standard methods are also given the new methods and new drugs which have proved their place in treatment

By HARRY BECKMAN M D Professor of Pharmacology Marquette University Milwaukee Octavo 893 pages 45s net

Christopher's Minor Surgery

"Sound advice,
"Superb illustrations,
"Invaluable"

"This is a very good book Its arrangement follows the usual lines except for the welcome addition of a long chapter designed for 'The Surgical Intern' This is full of sound advice which may be read with profit, not only by the house surgeon but also by his chief, and is mostly applicable to residents in our own hospitals The book is admirably printed on excellent paper and the illustrations are superb The consulting surgeon and the practitioner will find much to interest them, while the house surgeon will find it invaluable"—THE LANCET

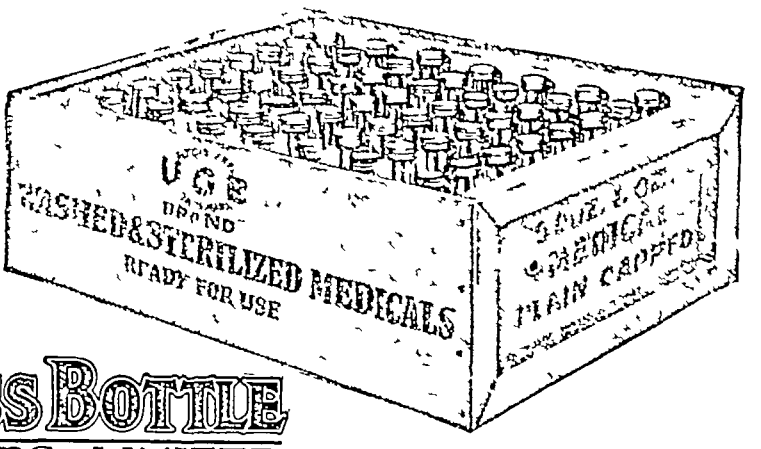
The U.G.B. MEDICAL BOTTLE Service



Photograph of actual package of Cork-mouth bottles with cover removed

THE U.G.B. Washed and Sterilized medical bottle service—introduced early in 1929—has proved to be an unqualified success, so much so that we were recently compelled to increase the capacity of our washing and sterilizing plant.

The screw cap service is in particular demand, and owing to the preference of users for a cap in a neutral colour, we have now standardized in fitting the bottle with an attractive RUSTLESS WHITE ENAMELLED CAP.

PRICES REDUCED

Apply to your Wholesale Distributor

BELLE VUE SPA

TREFRIW, NORTH WALES.

(Railway Station Llanrwst and Trefriw)

COMBINED TREATMENT OF ARTHRITIS

By Chalybeate Waters, Tonic Baths and Extension Appliances

The Belle Vue Spa Hotel provides accommodation for patients for whom these tonic chalybeate waters are indicated External treatment by tonic baths, as well as by manipulation and extension and light, is also provided

Recent analyses of the Belle Vue Spa waters show that they are exceptionally rich in ferrous salts Samples have been repeatedly examined by the Clinical Research Association

A new building furnished with Baths and all modern Electrical Appliances for treatment was opened on Saturday, April 26th

Under expert advice the drinking service of the Belle Vue Spa water is now taken from selected sources in the water-yielding rock, and served fresh at the Spa at a standard strength of 1 grain of ferrous sulphate in one ounce

For patients who are unable to visit Trefriw and take the water on the spot, it is bottled and exported at the same standard strength for medical use in their own homes

In suitable cases of arthritis and rheumatic disease Hoeffticke's manipulative and ambulatory extension treatment can be applied

Mobility and freedom from pain in crippling arthritis of the hip and knee can often be obtained, even after shortening and contraction have occurred This is effected by the extension appliances, which maintain continuous extension by day and by night The appliance usually permits the patient to walk, and not only supports the weight but replaces the undesirable state of compression of the leg by one of active stretching

This method secures —

(1) Extension without muscle loss inevitable whilst the patient is kept in bed
(2) Extension without vascular stasis which occurs when a joint is kept at rest
(3) MOVEMENT WITHOUT PAIN

The result has been a restoration of joint function in many cases which had been regarded as hopeless and incurable The Spa is under medical supervision and close co-operation is maintained with the patient's own physician

Further particulars may be obtained at Belle Vue Spa or 7 Harley Street W 1

Affords relief in all cases of high blood pressure

The daily exhibition of Sal Hepatica, the non-habit forming saline purgative, has proved of extreme benefit in all cases of high blood pressure. ¶ Sal Hepatica is also recommended as a rapid means of relieving the stress in cases of dysmenorrhea. One or two drachms administered on the morning before the expected period, and again at its outset, rarely fails to relieve both the pain and depression. ¶ In chronic constipation the regular exhibition of Sal Hepatica for a week or two restores the daily habit of defecation. ¶ Sal Hepatica is not a "patent medicine" and is only advertised to the medical profession.

"Sal Hepatica"

TRADE MARK

the proved medical saline laxative and cholagogue.

¶ Sal Hepatica contains sodium sulphate, sodium phosphate, sodium chloride and lithia citrate in an effervescent medium

Samples for clinical trial will be forwarded on request to duly qualified members of the medical profession on application to

BRISTOL MYERS COMPANY, 112, Cheapside London E C 2

HYPERPIESIS

HYPERPIESIS is described as "a malady in which blood pressure rises excessively, a malady having a course of its own and deserving the name of a disease"

A writer in *The Lancet* described cases of this condition, and ascribes its causation to toxic substances of the nature of which he is uncertain, but which he believes to be extrarenal in origin and to be distributed by the bloodstream

It seems highly probable that these substances are the "pressor" substances, such as epinephrine, which are developed by putrefactive bacteria in the intestine Assuming the truth of this likely hypothesis, the treatment in part should obviously consist in adequate intestinal disinfection

Certain compounds of the coal-tar series, having high germicidal value and little solubility in the alimentary tract, pre-eminently possess this disinfecting power and form the active constituents of Kerol, which may be given in a palatable form by means of keratin-coated capsules which ensure disinfection of the alimentary tract without deleterious effect.

For intestinal disinfection, use KEROL CAPSULES (keratin-coated), they contain 3 minims of Kerol One to three capsules may be given three or four times a day after meals

Intestinal Disinfection

Please send for Literature and Samples, which will be sent free to any member of the Medical Profession.

Food Poisoning—
The Kaylene Treatment

The following letter has been received.

Messrs KAYLENE, LTD

DEAR SIRS,

I am in receipt of your sample of Kaylene, for which I thank you I do not dispense and do not wish to be without some in the house

My last sample was used on a patient suffering from acute Ptomaine poisoning following a meal of shell fish (mussel) at 10 30 p m Symptoms first appeared at 12 30 a m, and when I saw him at 3 a m he was vomiting blood and passing almost pure blood per rectum He had commenced cramps and nervous twitchings which would shortly have gone on to tonic convulsions He was very collapsed and had a weak pulse I gave him **only** Kaylene in cold water, one drachm every quarter of an hour, from 3 0 until 8 0 a m, when I felt it safe to leave him For the next two days Kaylene was given every one to two hours, and was then followed by Kaylene-ol No other medication of any sort was used, and he made an excellent recovery This follows a somewhat similar case which I treated at the end of last year

Your excellent preparation should supplant Bismuth for any purpose

Yours faithfully,

Physician to———— ————, M B.

ALOCOL

Colloidal Hydroxide of Aluminium

For Chronic Irritations of the Gastric Mucosa

WHEN alkaline therapy is indicated "Alocol" is the preferred form of treatment Its advantages over the usual oxides and alkalis are manifest Whilst the preparations in common use give momentary relief to painful symptoms they aggravate the morbid condition Consequently such remedies are contraindicated, especially in stubborn, chronic cases

The action of "Alocol" is superior in every way, because it does not merely confine itself to combating the symptoms of the trouble, but attacks the origin itself

"Alocol" fixes the acid, not by neutralization, but by adsorption It relieves pain, is slightly astringent, and limits the acid secretions "Alocol" is always well borne, no harmful secondary action follows its administration, and its therapeutic effect is not diminished with prolonged use

Complete chemical history of Alocol, with convincing clinical reports and supply for trial, sent free to physicians on request

A Distinct Advance Over Preparations of Acetyl-Salicylic Acid

Acetyl salicylic acid possesses a notable disadvantage Physicians have proved that it cannot be tolerated by patients suffering with a delicate stomach Consequently, the value of this medicament in the wide field in which it is indicated is very seriously reduced

"Alasil" completely overcomes this objection By combining calcium acetyl-salicylate with "Alocol," unfavourable secondary action upon the stomach is prevented This beneficial influence is undoubtedly due to the presence of Alocol" (Colloidal Hydroxide of Aluminium), which preparation has brilliantly stood the test of practice in the treatment of hyperacidity and other ill conditions of the gastric tract "Alasil" is therefore a triumph over acetyl-salicylic acid It enables higher doses to be administered and maintains the patient's system under its influence for a greater length of time Analgesic, Antipyretic and Sedative, "Alasil" is indicated in all cases where acetyl salicylic acid has been used heretofore

ACTION ON THE HUMAN UTERUS OF ANAESTHETICS AND OTHER DRUGS COMMONLY USED IN LABOUR

BY

ALECK W. BOURNE, M.B., B.Ch., F.R.C.S.,

OBSTETRIC SURGEON QUEEN CHARLOTTE'S HOSPITAL; OBSTETRIC SURGEON TO OUT PATIENTS ST. MARY'S HOSPITAL

AND

J. H. BURN, M.D.,

DIRECTOR OF THE PHARMACOLOGICAL LABORATORIES PHARMACEUTICAL SOCIETY OF GREAT BRITAIN

(From Queen Charlotte's Hospital.)

We have previously described[1] a simple apparatus for recording graphically the changes in the intrauterine pressure taking place during labour. It consists of a disc-shaped rubber bag attached to the end of a gum-elastic catheter, and connected by a long rubber tube to a mercury manometer. When the bag and the tube are filled with water small changes of pressure exerted on the bag are accurately transmitted to the manometer and recorded on the surface of a slowly moving drum. The bag with attached catheter, carefully sterilized, is inserted with full aseptic precautions through the os uteri so that the bag comes to lie between the membranes and the wall of the uterus in a position well past the head of the foetus. For the insertion it is necessary that the patient has begun labour and that the os is dilated to a diameter of about one inch. By the aid of this apparatus we have previously obtained some evidence[2] about the dose of pituitary extract, measured in units, which may safely be administered before the birth of the child, and have also investigated the action of the alkaloids of ergot, and of the separated principles of pituitary extract, oxytocin, and vasopressin.[2]

We now describe records showing the effect of the anaesthetics chloroform, ether, nitrous oxide, and stovaine, of morphine, and of atropine, and finally of quinine.

THE ACTION OF ANAESTHETICS

The value of anaesthetics in labour has been much discussed in recent years, but in none of the discussions has there been any reference to the action of anaesthetics on the behaviour of the uterus itself. It seems elementary that for any final decision on the part which should be played by them in labour there should be a clear mental picture of what this action is.

Chloroform

Figure 1 is a record showing the effect of administering chloroform on an open mask to a patient in the first stage

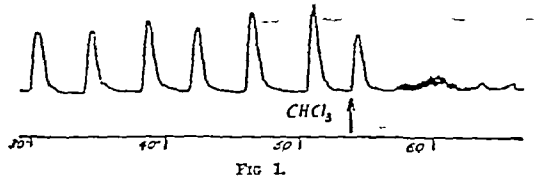

FIG. 1.

of labour. In the record the uterine contractions, shown as a rise and fall of the writing point, were proceeding regularly during a period of about twenty-five minutes. Chloroform was administered at the arrow, it is seen that the contraction which began at the first moment of administration was less than the others in height and that thereafter there were no contractions at all during the remaining twelve minutes of the record. It is evident that chloroform caused complete arrest of the pains. Now to see that so powerful an inhibitory action is not peculiar to the first stage of labour the result in Figure 2 may be examined. The record shows the characteristic rises of pressure within the uterus which are so different from those of the first stage. Superimposed on the rise due to the uterine contraction itself are further rises due to increased intra-abdominal pressure. Since some teachers state that these "bearing down" pains are voluntary, it may be as well to point out here why this is most unlikely. In our experience of a total of nearly fifty patients, the superimposed rise has only very occasionally been seen during the first stage of labour, it begins sharply with the second stage and is then seen with every pain until delivery. It is inconceivable that a voluntary effort could be distributed in this way. Cook[3] has shown, moreover, that in the fully anaesthetized rabbit at term the entrance of the presenting pole of the foetus into the vagina is accompanied by a very powerful contraction of the diaphragm and abdominal muscles. It seems likely that the superimposed rises of pressure in the human tracings are similarly due to reflex diaphragmatic contractions initiated by the passage of the foetal head down the vagina.

In Figure 2 the administration of chloroform on an open mask during a fully developed second stage at once slowed

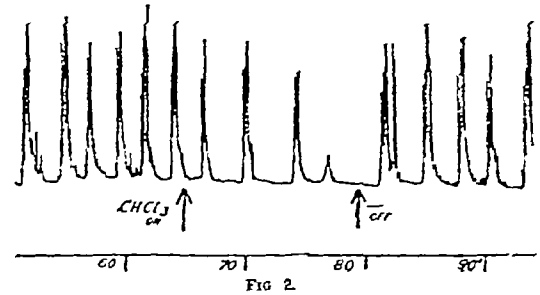

FIG. 2.

the frequency of the pains and reduced their height. During the last five of the fifteen minutes' administration there were no contractions at all. At this time the patient was not yet in full surgical anaesthesia, for there was considerable rigidity. Perhaps the most noteworthy feature of the tracing was the rapid recommencement of the contractions when the mask was removed, after about two minutes' delay a series of contractions was recorded almost as great in height and rate as at first.

Ether

There is a belief among some that ether is a stimulant to the uterus. The picture of its action given in Figure 3 shows that the belief has no foundation. The patient was in the first stage of labour, and the administration of ether, like that of chloroform, at once diminished the frequency and force of the contractions, when the anaesthetic was discontinued they rapidly resumed their previous size.

The action of both chloroform and ether is most probably not a direct action on the uterus, for it is too rapid. In

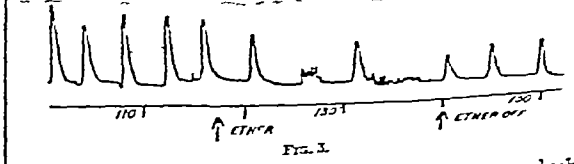

FIG. 3.

our opinion it is due to sympathetic stimulation which during labour is *inhibitory*. As evidence for this we point out that emotion arrests labour, and that, as we have already shown, an intravenous injection of adrenaline causes prompt cessation of the pains.[1]

Our evidence shows that the relief given in labour by a few breaths of chloroform or ether is not due only to the anaesthetic action, but at least as much to a diminution in the force of uterine contractions. Chloroform or ether is an ideal agent whenever a temporary brake on too powerful or too painful expulsive forces is required.

Nitrous Oxide and Oxygen

Figure 4 shows the record of a patient in whom anaesthesia with nitrous oxide and oxygen was induced during twenty minutes The contractions in this patient were not so regular in height and frequency as they commonly are, but nevertheless the complete absence of any effect of the anaesthetic on the contractions is evident "Gas and

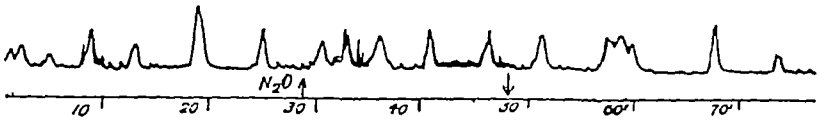

FIG 4

oxygen," therefore, is an anaesthetic which anaesthetizes without interfering with the progress of labour, in this important respect it stands in complete contrast to chloroform and ether

Spinal Anaesthesia

Spinal anaesthesia is not much used in this country, but is greatly used in some parts of the Continent, where very successful results are claimed In some women it produces a squint, but this is stated to be temporary and never permanent Whitehouse and Featherstone[3] some years ago described the effect of injecting tropacocaine into the spinal canal They said that "when the lumbar cord is paralysed by the drug the uterus always contracts, and it does not relax until the drug ceases to act" Further, they pointed out that "the lower uterine segment and cervix also appear to be involved in the increased uterine tone" More recently Metzger[4] has stated that the intraspinal injection of 0 7 c cm of a ten per cent solution of stovaine provokes a hypertonus of the uterus and that very rapid dilatation occurs On the other hand, Cheval[5] says that spinal anaesthesia delays labour, for the os will not dilate by itself We have examined the effect of stovaine in one patient, and the record obtained suggests the explanation of the statements made The dose injected was 0 05 gram Figure 5 shows that while the rhythm of the main uterine contractions was not perceptibly altered, there was a maintained rise of pressure in between each contraction A line has been drawn through the base of the record before the stovaine was administered, and it can be seen that the continuation of this line is appreciably below all points on the line recording the pressure afterwards In this respect the action of the stovaine resembles that of ergotamine, the normal process, which is contraction followed by complete relaxation, is interfered with, and relaxation is never complete

Hence our experience agrees with that of Whitehouse nd Featherstone, our method of recording the intrauterine pressure enabling us to analyse the effect more closely It is clear that if stovaine be injected early in the first stage before dilatation has advanced very far, this contraction of the lower segment will hamper further dilatation, as Cheval has found On the other hand, if the dilatation is complete, the "hypertonus" described by Metzger will be apparent, and delivery will be hastened

Morphine

In Figure 6 is shown a record of a patient to whom an injection of 1/4 grain of morphine was given during the first stage of labour During the first quarter of an hour after the injection there was no change in the contractions, but thereafter there were two important differences In the first place, the relaxation of the uterus after each contraction was much slower, and in the second place, the frequency of the contractions was less than before It is readily understandable that the first of these changes, both of which were observed in a second patient in similar circumstances, may be of considerable value in accelerating the progress of labour, for if the relaxation from each contraction be slower, it follows that the time during which useful work in dilating the os is performed must be considerably increased Yet the continuous pain to which such a prolongation of the contraction must ordinarily give rise is precisely the type of pain from which morphine gives relief Hence morphine is an agent which, by prolonging the duration of contractions, may accelerate the progress of labour, and yet not add to the embarrassment of the patient in doing so

Though we have had the same result in two patients, clinical experience indicates that the action of morphine is not always the same How far a difference in the action on the central nervous system of different patients is correlated with a difference in the action on the uterus, we are unable to say

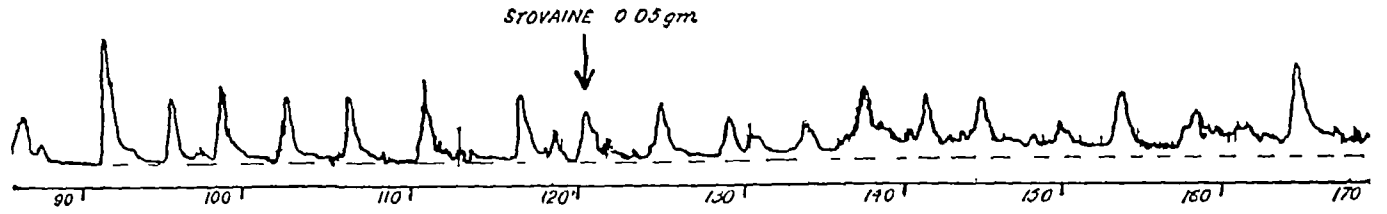

FIG 5

Atropine

The view has been expressed that atropine should not be used as a prelude to anaesthesia in parturition, because it may produce an inhibition of the uterus This opinion would be more reasonable if it had ever been shown that the uterus has a nerve supply by way of the sacral autonomic fibres for the transmission of motor impulses A paralysis of uterine contraction could then occur from the paralysis of the nerve endings which atropine would produce No such motor nerve supply has been found, nevertheless it remained a matter of interest to determine whether atropine in ordinary dosage had any action in

FIG 6

labour Figure 7 shows the effect of the administration of 1/100 grain To our surprise the record showed an increase in the height of the contractions characteristic of the passage from the first to the second stage of labour It is perhaps unwise to conclude from this single instance that the increased height was really due to the atropine, for the injection may by chance have coincided with a change which would have taken place anyhow It is, however, quite safe to say that atropine, in the dose given, displayed no trace of an inhibitory action

Quinine

Quinine is largely used when it is hoped to induce labour, but few obstetricians appear to find it useful Rubsamen[6]

actually investigated its action by the use of a recording system attached to the abdomen of patients in labour, and concluded that whereas it had little effect before labour had begun, it reinforced the pains afterwards Our own experience has been more depressing than this, for results obtained on two patients both show very little

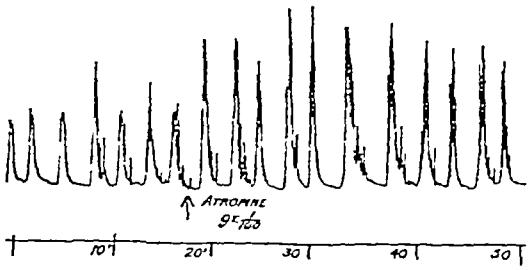

FIG 7

effect of a kind calculated to hasten delivery In Figure 8, 10 grains of quinine bihydrochloride were injected into the *gluteal muscles of a patient* in the first stage The main effect of the injection appeared to be that the periods of relaxation between pains became shorter, so that contractions were more frequent, but that the height of each contraction was less than before It was surprising that there was no clear indication of a stimulation of the uterus by the quinine in the same way as there is when a small dose of pituitary extract or a large dose of histamine is injected It is evident that the powerful action of quinine on isolated portions of smooth muscle when suspended in a bath is little guide to its effect on the uterus in labour, *and that its action on the parturient human uterus* has been much overstressed

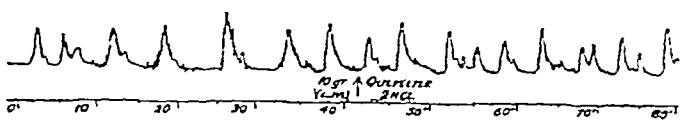

FIG 8

DISCUSSION

The importance of a knowledge of the effects of anaesthetics both on the uterine action and on the patient's general state is considerable, especially at present when much attention is being devoted to the problem of alleviating the pain of labour

We will first recapitulate the advantages and disadvantages which are agreed to attach to chloroform, ether, and gas and oxygen respectively as general anaesthetics Chloroform produces its effect in the smallest concentration Attending its use there is a risk of sudden death from cardiac fibrillation, and a more important risk of delayed chloroform poisoning We understand that in the United States it is now very little used at all Ether has the disadvantage of inducing infections of the pulmonary tract Both chloroform and ether cause damage to the circulation by producing a degree of capillary paralysis proportional to the length of time they are administered, as was shown by Dale [7] Gas and oxygen has none of these drawbacks, but it is expensive, its administration requires much more skill and attention, and it cannot ordinarily produce a full degree of surgical anaesthesia

These are the points involved in considering the production of general anaesthesia In midwifery, however, different varieties of anaesthesia are required Light anaesthesia is most commonly wanted for the end of the second stage, secondly, prolonged light anaesthesia may be wanted throughout the whole of the second stage finally, full surgical anaesthesia may be required For light anaesthesia at the end of the second stage the arguments given above relating to general anaesthesia do not apply, and we think that chloroform or ether is suitable The amount of chloroform which needs to be given is very small, and the reduction in the efficiency of the contraction which it causes is often of benefit in avoiding perineal tears Experience at Queen Charlotte's Hospital since this form of anaesthesia has been used in normal labours shows that there has been no appreciable prolongation of the second stage, nor increased incidence in the forceps rate In a series of 562 cases there has been no increase in the incidence of post-partum haemorrhage when compared with a previous series of the same number without anaesthetics and there has been no case of chest complication or delayed chloroform poisoning The condition of the infants was materially the same whether anaesthetics were used or not

For prolonged light anaesthesia, throughout the whole of the second stage, the use of chloroform or ether is open to more objection Boyle [8] has recently made a strong plea for the use of gas and oxygen in place of chloroform, for he says that patients are far less exhausted and that the pains are not slowed The question seems to us to depend on the amount of chloroform to be used, and we think that in many circumstances Boyle is right But in domiciliary practice, at any rate, the weight and expense of the necessary apparatus render gas and oxygen very difficult for routine use

When full surgical anaesthesia is required, we think that whenever possible ether should be substituted for chloroform, combining the ether with the hypodermic injection of atropine It is to be remembered, however, that ether is highly inflammable, and the risk of explosion in an ill-ventilated room with an open gas fire may be considerable But from the point of view of the patient there seems little doubt that the use of chloroform is not in keeping with modern enlightenment

SUMMARY

1 Records of intrauterine pressure have been obtained showing the effect of anaesthetics and other drugs on the contractions during labour

2 The administration of chloroform or ether on an open mask at once arrests the contractions in the first stage, and diminishes their force and frequency in the second stage The effect comes on rapidly, and passes off rapidly when the administration is discontinued The action of ether is the same as that of chloroform

3 The administration of gas and oxygen has no effect on the contractions during labour

4 The intraspinal injection of stovaine does not inhibit the contractions, but interferes with full relaxation between the pains This appears to be due to continuous contraction of the lower segment, and if stovaine be given early in the first stage dilatation will be delayed

5 Morphine lessens the frequency of uterine contractions, but the pains pass off more slowly, so that the work done by the uterus is probably as great as or greater than before, despite the lessened frequency

6 Atropine appears to stimulate the contractions of the uterus It certainly has no inhibitory action

7 The stimulant action of quinine during *labour* is very small

The Morison Lectures

ON

NERVOUS SEMEIOLOGY, WITH SPECIAL REFERENCE TO EPILEPSY

DELIVERED BEFORE THE ROYAL COLLEGE OF PHYSICIANS OF EDINBURGH ON JUNE 2ND, 3RD, AND 4TH, 1930,

BY

S. A. KINNIER WILSON, M.D., F.R.C.P.,

NEUROLOGIST AND LECTURER IN NEUROLOGY, KING'S COLLEGE HOSPITAL, SENIOR PHYSICIAN TO OUT-PATIENTS, NATIONAL HOSPITAL, QUEEN SQUARE

LECTURE III.—SYMPTOMS INDICATING INCREASE OF NEURAL FUNCTION (*continued*)

LOWEST LEVEL FITS

As already explained, this term is taken in a wider sense than that given it by Hughlings Jackson, and made synonymous with "infracortical fits."

The question whether the neural site of *general* epileptic seizures is of necessity always the same has received some attention, and been examined by myself elsewhere (ref. 19, Lecture II). Briefly, it amounts to this: can then motor phenomena be produced at other (lower) levels than the cortical? The experimentalist has shown that in the decorticate or decerebrate animal fits of a general kind can in point of fact be made to develop by resort to convulsants such as absinthe or thujone, and the distinction sometimes still advanced by the clinico-anatomist, that the clonic element in fits is of cortical origin, the tonic of infracortical, cannot be upheld in its entirety. Both tonic and clonic convulsions have been produced by Pike and Elsberg[30] in animals deprived bilaterally of the cortical motor areas, an interval of time sufficient for the return of "good locomotor reactions" being allowed to elapse after operative intervention; Dandy,[31] it is true, claims to have proved that in the dog the cortex is required for the clonic component. In full decerebration, with only pons, medulla, and cord left, convulsions of a more or less general kind may develop during the respiratory sinking that presages the death of the preparation. But whether these are identical *in all respects* with those occurring experimentally in the intact animal can be settled only by precise observation, and so far as I am aware this has not yet been forthcoming. In regard to man the evidence undoubtedly points to important differences between fits of higher and of lower origin, as we shall see.

Taking our stand on the position that fits of any kind are fundamentally expressive of the functions of the part or parts affected, we must at once allow for the greatest diversity and heterogeneousness. A major attack ranges from a disturbance on the highest plane (the aura) to phenomena of a visceromotor kind, through the whole scale of semeiology, and fits ostensibly caused by disorder in infracortical mechanisms cannot do otherwise than reveal the functions which these possess. The clinician tries to deduce the localization of a given attack by scrutiny of its functional features, correlating what he observes with knowledge otherwise derived. Facts compel us to admit that the property of uncontrolled discharge is common to all nerve-cell groups on occasion, even though we draw a distinction between permanent instability in a diseased tissue and occasional instability in a healthy tissue, and it stands to reason that if this generalization is accepted we may expect such syndromes as are specific for mechanisms of a given level. But one of the difficulties immediately encountered is to decide whether the observed phenomena partake of the general nature of a "fit." I confess this interpretative question becomes almost impossible to answer in any completely satisfactory fashion. The expression "genuine" epilepsy is little short of meaningless, such epilepsies as grand and petit mal are usually recognizable—the Jacksonian variety too—but clinical manifestations of analogous release or excitation in other divisions of the nervous system do not always convince the observer of their right of admission to the general category. Sometimes I envy the man in the street, who can talk of his symptom as a "turn," a "go," a "do," non-committally yet graphically, whereas science compels the neurologist at least to try to give it a local habitation and a name in conformity with its physiology and nosology. As neural semeiology consists simply of hyper- and hypo-activity it is open to the clinician to claim any temporary, disorderly, paroxysmal, recurrent, uncontrolled manifestation of either motor or sensory processes as in essence a "fit," and this on any physiological plane. Does not common parlance permit the phrases "a fit of the blues," "a fit of temper," "a fit of laughter," and so forth? Then why not a fit of neuralgia, of tachycardia, of polyuria? Unfamiliar and possibly bizarre though such conceptions may seem, they do not differ integrally from "a fit of asthma" or "a fit of sneezing," which some will concede are allowable. Provided the phenomena partake of the general nature of a "fit" as just mentioned, with a substratum of physiological escape, it will be difficult to deny their intrinsic likeness to each other however protean their external aspects.

Such general comments are apposite to the question now before us, which can be approached by discussion of various infracortical groups.

"Striatal Epilepsy"

Within recent years the term "striatal epilepsy" seems to be enjoying a certain vogue. In 1925 Professor August Wimmer[32] of Copenhagen recorded the case of a patient whose symptoms commenced by attacks of unilateral tonic spasm, lasting a few seconds, unattended by loss of consciousness, and recurring many times a day. Later they became generalized, and an eventual diagnosis of epilepsy was made. At a subsequent period involuntary movements of an athetoid type made their appearance, and finally the clinical picture became one of typical torsion-spasm. Because of the possibility of the latter condition having a striatal basis, Wimmer designated the tonic attacks and (more or less tonic) generalized fits "striatal epilepsy," supporting his contention by reference to a case observed by Steitz,[33] in which generalized seizures preceded the development of torsion-spasm and the lesions discovered post mortem were confined to lenticular and caudate nuclei. He also found substantiation for his argument, as he maintained, in the occurrence of epileptic attacks along with post-encephalitic Parkinsonism. Preferring the expression "subcortical epilepsy," Spiller[34] published in 1927 two cases of attacks of brief tonic spasm—in one, affecting both hands and a lower limb, in the other, the arm and leg on the same side. These spasms (no clonic element was in evidence) were brought on by voluntary movement of the limbs concerned in both instances, and in one could also be elicited by passive manipulation, further, the muscular contractions were painful and accompanied by a thermal dysaesthesia of "heat" or "burning" in the lower limb unaffected by the spasm. Because of a concomitant cervical sympathetic palsy in the case that ended fatally (no necropsy being allowed) Spiller suggested a lesion in the regio subthalamica, possibly haemorrhagic (there had been evidence of meningeal bleeding in the case at an earlier stage). Still another term, "extrapyramidal epilepsy," has been proposed, by Sterling,[35] for cases of spastic contractions in the course of post-encephalitis or during a more acute period, distinguished by painful spasms of fingers or toes, limbs or segments of limbs, and inclusive of facial and torticollic movement, brief or prolonged, the muscular phenomena are essentially intermittent and often paroxysmal, and their frequently "tetanoid" or "tetaniform" character is stressed in the title of his paper.

This plausible association of tonic spasms or painful spasmodic contractions with destructive lesions of the corpus striatum must, however, be examined under very considerable reserve. Naturally I accept any view ascribing tonic spasm to the group of the epilepsies in a general way, provided it occurs in "bouts" or "fits," so to say, but when the element of pain enters prominently into the motor contractions the case is somewhat altered. Clinically speaking, not a few of the examples cited, more especially by Sterling, can be fairly assigned to that class of painful cramps, and it seems inadvisable to widen the horizon of the epilepsies, almost limitless though that may appear to

be, by inclusion of a clinical category of such distinctiveness, equally well might we place the phenomena of intermittent claudication in the same collection By common consent tetanus and tetany remain outside the epileptic *rails, yet one of Sterling's examples of "extrapyramidal* epilepsy" presented contractions of the hands and fingers, occurring daily for nine days and lasting two to three hours, exactly like those of tetany Similarly, in the peculiar cases we owe to Spiller the facts that the muscular contractions themselves were dolorous and (in particular) that they arose in consequence of active, voluntary movement, in my opinion render their ascription to any of the epilepsies, as ordinarily understood, more than a little dubious Painful reflex spasmodic phenomena occur under a variety of different circumstances the cramps of cholera are etiologically distinct from those of ballet dancers or swimmers, which ensue on voluntary movement, and each from those of encephalitis, but they are clinically alike in the elements of paroxysmal painful tetanic muscular contraction, and we should proceed warily in the matter of regional allocation I share Spiller's own clearly expressed hesitation as to the precise nature of the symptom-complex in his cases and his unwillingness to accept a striatal origin for them

Further, on previous occasions I have animadverted on the irrational attribution of motor phenomena to affection of the corpus striatum merely because of their occurrence in the course of epidemic encephalitis, and I take the opportunity of underlining again this *non sequitur* Implication of the pyramidal system for spasmodic syndromes is not excluded because Parkinsonism and its rigidity may be indirectly due to striatal lesions So far as I have noticed, the obvious comment has not been given any consideration, that such tonic spasms, being release or excitatory symptoms, cannot result from outfall of striatal cells Neither the generalized fits nor the torsion-spasm of Stertz's case can have been *caused* by the destructive lesions of the caudate and lenticular nuclei found on microscopical examination by Spielmeyer It is immediately plain that the actual mechanisms involved in the production of these tonic movements must have occupied an extrastriatal position

There is no novelty whatever except its proposed name in this conception of "striatal epilepsy" Reference to the old descriptions of Ormerod and Gowers in respect of their cases of lenticular degeneration (quoted in my monograph[34] on the subject) shows that "tonic spasms" were even then recognized as forming a part of the clinical picture Gowers employed the epithet "tetanoid" for the contractions in his cases, and said of the first that "the muscles of the neck, trunk, and limbs were all involved, in varying degree, in the generalized tonic spasm", and, again, "the spasmodic contractions of the musculature became intensified," etc The value of this old clinical evidence of the development of tonic contractions in the course of a striatal affection is in no sense diminished by our inability to attribute them directly to striatal cell-fibre systems I have myself from time to time observed analogous cases, though they have never been reported One may be selected for illustrative purposes the patient came under my care in 1923, two years before the publication of Wimmer's interesting paper

A boy 5 years old noticed to have been more or less fidgety since birth but with no previous illness except German measles began to suffer from indefinite involuntary movements with a propensity to affect the left limbs and side They offered some resemblance to choreo-athetosis without being quite characteristic of either subgroup After a year or two it was observed that following any insignificant jar knock, fright, or excitement the boy lost power down the left side for two or three minutes the left leg inverted and assumed an equinus position while the left arm flexed at the elbow and was held in front Unable to speak he did not lose consciousness The attack was very often (not it appeared invariably) preceded by a sensation of pain starting in the left foot and passing up the trunk to the shoulder and then coming down the left arm to the hand When the sole of the left foot was stimulated (as in testing the plantar response) an inversion spasm of the limb took place while pain was experienced and shot up as high as the left shoulder

On minute examination however no definite objective sign of organic nervous disease was discovered.

The boy has been under my continuous observation now for more than seven years and I have seen a number of the tonic attacks, which can be thus succinctly described the left foot extends and becomes inverted the left leg is *in tonic extension*, the head is bent over to the left and the trunk arched slightly, with concavity to that side the arm is flexed at elbow somewhat abducted at shoulder and stiff throughout, while the fingers are commonly flexed Some spasm of the left orbicularis oris is observable, but the mouth is not drawn over Consciousness is preserved the boy does not drop anything he holds in the affected hand, yet does not answer questions while the attack is on Its duration has gradually become shorter, now lasting no more than thirty seconds By 1929, at length signs of change apart from the fits made their appearance, in the form of enduring rigidity and some weakness of the left leg, and at the present time the facies and ensemble are indicative of a mixed pyramidal and extrapyramidal affection—a slight unilateral paresis and equally slight suggestion of Parkinsonism

On purely theoretical grounds this unusual case can be represented as one of *reflex unilateral tonic epilepsy* and feasibly be thought infracortical in origin mainly, no doubt, because of its tonic type, but I do not myself consider the symptoms can be attributed to excitation of striatal arcs The aura follows a physiological "march" corresponding to the arrangement of centres in the post-Rolandic cortex, while the extension and equino-varus postures of the left leg are of pyramidal type Pain of cortical derivation is not unknown, and the reflex nature of many of the fits rather favours a similar site for them, as I think at least, the element of conscious perception of the stimulus is not excluded from acoustico-motor and other reflex epilepsies adjudged by some to develop at lower levels But still, the absence of the clonic element impresses, even if strict proof is awanting of the striatal or extrapyramidal locus of the spasms In this connexion we do well to remember that when in Jacksonian epilepsy the "second side" becomes implicated, its contractions are sometimes tonic rather than phasic, and take the whole side much more quickly than in the case of the one first involved I have had under care recently a little girl whose epileptic attacks throw the left limbs and face into clonic spasms, with head and eyes deviated to the left, but the right arm and leg remain in tonic extension, and the abdominal muscles of the two sides are boarded in *strong tonic contraction equally, without twitches* Until further study enlightens us it is premature, in view of what has already been said by way of criticism of the "striatal" conception, to assign tonic manifestations to activity of the basal ganglia when we know they can also develop in other ways, as is now to be discussed

Tonic ("Cerebellar") Fits

The occurrence of general tonic seizures (leaving aside the mainly segmental and unilateral tonic spasms to which some attention has been given above) has long been a neurological commonplace Described by Hughlings Jackson as 'tetanus-like seizures," sometimes as 'cerebellar fits," in their essence they consist of tonic contraction of extensor groups of trunk and limbs, with temporary head retraction and opisthotonos occasionally the upper extremities are flexed rather than extended and emprosthotonos may take the place of the other *A full description* of a number of such cases was published in my paper entitled "Decerebrate rigidity in man and the occurrence of tonic fits" (1920) and various others gathered from a somewhat sparse literature were referred to Since that time more have come under personal observation while from his wide experience Foerster[35] has collected a series of the same kind Martin," too has published an interesting quartette of cases of pure tonic fits in association with syringomyelia, attributing them with some plausibility to rise of intracranial pressure and internal hydrocephalus—no uncommon finding in the disease

Speaking generally haemorrhage, abscess or tumour of the cerebellum or of pons, medulla and cerebral peduncles, haemorrhage or rupture of an abscess into the ventricular system, meningitis, and other basal conditions calculated

to interfere with fluid circulation between that system and external arachnoid spaces, are among the pathological conditions apt to be causative of generalized tonic fits Their association with a state of decerebrate rigidity is far from infrequent, in such cases they occur as temporary exacerbations, accentuating and exaggerating the background of tonic posture in extension Again speaking generally, it can be shown that fits distinguished by the assumption of tonic attitudes and the appearance of tonic contractions are most likely to develop when the lesions of the case dissociate physiologically the cerebral hemispheres from cerebello-mesencephalo-pontine levels, and when, therefore, striatal function also is in complete abeyance An instructive case which bears out this statement indirectly has been recorded by Reynolds[40], it is that of a girl of 15 whose grand mal attacks, before any operation, consisted of "(1) tonic emprosthotonos, in which she remained rigidly anteflexed and silent for about twenty seconds, (2) as the trunk relaxed, the head and eyes commenced to jerk clonically to the right and the right hand entered into clonus Then (3) the movements became slower and ceased, and she wept as if frightened," etc He was able, by operating and draining the cerebral cortex above the tentorium, to dispel the clonic element altogether and leave only the basal tonic element, at this stage the fits continued as purely tonic and emprosthotonic in character for two weeks, after some twenty of these, bilateral suboccipital drainage of the arachnoid space immediately and permanently dispelled this residuum, and neither type of fit has recurred since

In their elaborated form the picture is unmistakable, especially when evidence of coexisting organic nervous disease of one or other type as alluded to above is at hand But brief tonic fits, not much more than a rather elaborate petit mal seizure, also occur, and deserve mention because of their unusual features A recent case is that of a girl of 14, whose so-called "menstrual epilepsy" is as follows a sudden inspiratory cry is succeeded by stretching out rigid arms in front while neck and back are contracted in powerful opisthotonos and she falls back with a crash, legs extended and stiff, cyanosis at once sets in, and involuntary micturition takes place With almost equal abruptness the musculature relaxes, consciousness returns, and violent vomiting ends the attack No clonic movement of any kind has ever been seen

The close resemblance of the fits in this case to those of the patient of Wimmer (mentioned above) should not be overlooked, the latter comprised initial cry, generalized tonic contractions with loss of consciousness, cyanosis and tongue-biting, without, however, sphincter relaxation Yet Wimmer, who himself diagnosed ordinary epilepsy at first, was influenced by the subsequent development of torsion-spasm and called the condition "striate epilepsy" accordingly Since variants of this kind are encountered by themselves, "idiopathically," with undiscoverable causation, it appears to me improper, and for the reasons already advanced unjustifiable, to allot them any such topical designation

At this point, too, another aspect of the question of tonic fits may not be out of place The neurologist is aware that convulsive hysterical seizures no longer constitute a clinical banality Nothing should appear to any thoughtful mind more evident than that hysteria follows the scientific movements of the day and adapts itself to progress in medicine Hysterical fits in the grand manner are out of fashion Years have elapsed since last I saw a typical case of the *arc de cercle*, and I remember that Babinski showed at a medical congress a cinematograph record of all the phases of the attack because he considered it would ere long become of purely historical interest! Now while hystero-epilepsy may assume any form, as it were, undoubtedly one special class of fit is distinguished by the patient's musculature becoming contracted in rigid extension, head retracted, back curved, arms extended and hyperpronated, legs extended, and feet inverted Here I am interested not in the possible psychogenesis of the attack, but in its physiology For there can be no doubt that it offers intimate affinities from the standpoint of *form* with what obtains in fully developed tonic fits attended by physiological decerebration We commit ourselves to no theory of hysterical etiology in underlining the fact that the neurosis can have at its disposal only the existing sensorimotor processes of the individual patient, and it is legitimate to stress the symptomatological analogies between the two types when the *mechanism of production* of the symptoms is concerned I well remember a hysterical patient who, when she entered the out-patient clinic, fell on her back in rigid extension, crushing her hat under the back of her head on the floor, toes down-pointed, arms straight out and pronated till the backs of her hands touched Investigation revealed a wretched history of incest and psychical trauma, but the *form* of the attack is not explained thereby The physiology of hysteria is one of many matters in neurology which call for serious research I confess my ignorance of why convulsive hysterical manifestations partake so frequently of a tonic character, the once-debated question of the reality or otherwise of hysterical Jacksonian epilepsy seems now to be forgotten, presumably because it is thought to have been "decided" in the negative, but why then this mimicry of organic tonic fits?

Periventricular Epilepsy

A final grouping of lowest level or infracortical fits includes those in which symptoms of an affective and viscero-sensorimotor kind predominate Everyone who has made a study of epilepsy knows with what frequency symptoms referable to the neuro-sympathetic system are in evidence, momentary arrest of the heart's action, pallor, sialorrhoea, sphincter relaxation, and other analogous phenomena occur to the mind in this connexion As the "discharging lesion" sweeps over different physiological levels or implicates a succession of physiological centres it does not appear in major cases to exercise any selectivity Whether this is through representation of visceral activities at the highest physiological level need not at present detain our discussion, anatomically speaking, we know of sympathetic centres in the brain representing lower nervous arrangements, but so far they have not been traced with certainty to the cortex itself We shall therefore take the attacks to be now considered as indicative of functional activity on an infracortical plane

In the spinal cord a general division of cell-fibre groups into four systems or columns is obvious—namely, somatic sensory, somatic motor, viscero-sensory, and viscero-motor respectively These are readily recognizable at prespinal levels—namely, in medulla and pons—and the point of interest to which attention is directed resides in the relation of the visceral and somatic-sensory columns, particularly, to the ventricles of the cerebrum At the level of both medulla and pons they fringe the margins of the fourth ventricle, the thalami are lined by the third, and researches of recent years have thrown a great deal of light on the various visceral ganglionic collections skirting the floor and lower sides of the same third ventricle, as far back as the commencement of the aqueduct That the major portion of these centres, concerned with *la vie affective* and *la vie vegetative*, is situated round the ventricular system cannot be without significance It is therefore permissible to speak in general terms of "periventricular epilepsy," by which may be designated cases remarkable for localization of the disorder in neuro-sympathetic centres, at least in major degree, to the exclusion (absolute or relative) of sensorimotor phenomena of somatic type

The actual nucleus or focus of the "nerve-storm"—the "storm centre"—cannot perhaps be determined with any nicety, for if we are to conceive of the sympathetic system as an anatomical continuum (in accordance with the conclusions of Philip Stohr[41] and others) it becomes difficult to ascertain whether peripheral or central cells form the starting-point, besides, as has been remarked in a previous lecture, we must postulate an open way between the focus and the percipient cortex, since in few of the seizures to be described is consciousness ever lost, on the contrary, the subject is only too acutely aware of some violent disorder referred to his viscera, and equally incapable of inhibiting it The assumption must be that abnormal impulses *ascend*

to the cortex and are there interpreted as accurately or (for most instances) as imperfectly as may be in accordance with previous experience or with want of it

1 Prominent in the general category of affective or visceral epilepsies come the "fits known (after Gowers) as "vaso-vagal attacks,' or pseudo-angina,' or popularly as "nerve storms", in their physical concomitants they are akin to what the psychiatrist is nowadays in the habit of designating "anxiet neurosis" Cases exhibiting the syndrome to be described immediately have interested me for many years and I have collected a large number from private and hospital practice and in an article[12] on 'epileptic variants" the subject has been given attention and analysis

Briefly to quote from that paper "the patient complains of attacks of palpitation at the heart difficulty in breathing, a suffocating sensation in the throat, hot flushes icy coldness, sweating shivering and trembling nausea and other epigastric sensations and often, also an indescribably distressing feeling of impending trouble of fear even of imminent dissolution' The symptoms of the vaso-vagal attack point in a general way to temporary functional disturbance referred to organs supplied by the pneumogastric nerve presumably initiated in the vagal nuclei of the floor of the fourth ventricle and in the neighbouring vasomotor nucleus But radiation along neuro-sympathetic paths therefrom is usual enough in particular polyuria and pollakiuria are very common at the close One or two hitherto unpublished clinical cases will serve for purposes of illustration

A. C B male aged 58 suffers from fits commencing with flatulence and eructations followed after a time by a sinking sensation at the epigastrium throbbing heart's action vertigo nausea clammy sweating and trembling of the body and limbs an agonizing dread of something unpleasant about to happen develops when the attack is in full swing Its duration is perhaps from fifteen or twenty minutes to two hours during which (if it is rather prolonged) he will pass water freely quite six times or even more It may amount to a pint of clear limpid urine the first time but subsequent quantities are on a smaller scale

This patient has a persistently low body temperature, ranging from 95° to 97 4° F on none of the various occasions when it has been taken by a medical man has it been higher

Interesting features distinguish another case of the same class

G N male aged 47 has attacks in series four to six a day for five or six days with an interval of weeks thereafter Lasting for about thirty seconds, they begin with a sudden "jump' at the heart ' as though it were coming into my mouth and to this succeed a peculiar feeling in the finger-tips which seem oily and smooth icy coldness (even the inspired air seems somehow for the time colder than usual) giddiness pallor, trembling and inability to speak As the attack finishes an overpowering 'nightmare of depression seizes him, making him feel frankly suicidal. Every hour (for hours at a time) when the serial fits develop he voids clear watery urine in quantity

Especially worthy of note is the fact that in this case the "turns," which have continued for some twelve years were at first invariably heralded by an unpleasant, "rotten" taste in the mouth, bringing with it a strong feeling of familiarity ("I have tasted this somewhere before"), and a peculiar dreamy sensation (in itself not unpleasant) "exactly as if I were going under gas" For the last two years, however, this uncinate aura has not recurred To the student of the subject its association with periventricular epilepsy must appear highly informative, for in the first place the fact that a "visceral" or "affective" attack follows stamps the latter with the epileptic seal and justifies its acceptance as an epileptic variant, and, in the second the radiation from temporo-sphenoidal to ventricular locus exemplifies an unusual line taken by physiological excitation or release, and suggests the possibility of still others

Another instructive association is illustrated by the next case

Mrs B aged 59 exhibits an old left juvenile cerebral hemiplegia dating from the age of 12. For the last year she has suffered almost daily from attacks which commence with a sensation of something moving or fluttering in the stomach this 'something passes up the body into the left arm where it becomes a burning crawling feeling" "as if my arm were being gripped round with red hot wires the sensation extends to the tips of the left fingers and is described as if something stinging were trying to get out through the skin At the same time palpitation starts linked to a vague fear of impending evil the patient feel sick and giddy shivers all over (I can't keep a nerve still) and perspires clammily but solely in the left upper limb arm and hand never on the right Immediately after the fit she passes a large amount of clear urine every half-hour for usually three or four times

The interest of this case consists mainly in the peculiar connexion of visceral and somatic sensory auras, the initial vagal aura (stomach and heart) radiates over to a cortical sensory area—presumably a *locus minoris resistentiae*—whence in consciousness is experienced a definite Jacksonian sensory aura confined to the affected left arm The fact of the sweating being restricted to that somatically involved limb is equally noteworthy Within the neurone impulses can spread by unexpected and unsuspected routes in particular circumstances Several clinical examples of the association of migraine for instance, which is not supposed to be of periventricular origin with these visceral attacks have come under observation, and one may be cited

D B female aged 35 unmarried has suffered from sick headaches for years These take a more or less classical form with persistent vomiting visual phenomena (not however teichopsia) unbearable headache tenderness of scalp photophobia etc They last usually for forty-eight hours In the course of the migraine (which is always preceded by a day or two of pronounced physical and mental euthonia) the patient's hands and feet become icy cold and the head hot palpitation and anxiety develop and a mild degree of sweating At this stage she invariably keeps passing water at short intervals up to as many as twelve times in succession

Though just an episodic syndrome, an epiphenomenon of the migraine its interest resides in the linking together of cerebral centres by paths not commonly open to traverse

Finally in this connexion I must allude to a recent case which illustrates still another of these combinations, and that along distinctly unusual lines

C C male aged 23 unmarried has suffered from peculiar attacks for six years at irregular interval They commence by a sensation at the heart (as if it were moving round in a circle to the accompaniment of painful pricks) and in the stomach (the organ seems to turn right over) and the usual sequence of giddiness shaking hot waves etc is experienced in rather severe degree Thereafter the patient feels extremely sleepy and sometimes actually falls fast asleep He has often observed that the fits are brought on by unrestrained laughter and sometimes too by his being tickled at such a moment he is suddenly seized by the pain at the heart and the syndrome forthwith unrolls itself

To my mind the case is deeply significant, no similar instance of the provocation of the vaso-vagal fit by the emotion which causes laughter has hitherto come under my notice Clearly it furnishes a link on the one hand with narcoleptic semeiology, in the association of laughing and sleep, but while there is no evidence of cataplexy on the other, yet the production of a periventricular fit by a stimulus which in other circumstances gives rise to the cataplectic attack undoubtedly narrows the gap between narcolepsy and epilepsy I have seen two cases of epilepsy in which the aura was one of motiveless and compulsive laughter, and there are instances on record of epileptic fits having been induced by that act itself resulting from tickling the soles of the feet (Feré[13] quotes those of van Swieten, Esquirol and Reynolds) Since in by far the greater number of cases of vaso-vagal fits the manifestations are attended by a feeling of apprehension, anxiety, or even of terror, it is curious to observe their origination in an emotion of a pleasurable kind The mechanisms of 'let go by the act of laughter deserve physiological study its visceral concomitants include dilatation of capillaries (the skin reddens and glows), glandular secretion (the eyes sparkle we laugh "till we cry") vulgarly, also we laugh until sphincter relaxation is imminent We nearly "die of laughing", we are "tickled to death" Is this seeming clinical novelty, then akin to the last of these? The patient laughs or is tickled into laughter, till suddenly affected by a paralysing disorder of his cardiac

and respiratory mechanisms I confess I find his case of peculiar scientific interest, but am content at present to sketch it in outline

2 Less definite in constituent features, but equally suggestive of periventricular dysfunction, are cases distinguished, *inter alia*, by yawning One may be taken from a previous communication[12] by way of example

C L, male, aged 25, has had peculiar fits for about one year, recurring on an average at fortnightly intervals They are constituted by continual yawning with constant voiding of urine, and are followed by violent giddiness, headache, and occasional vomiting A family history of epilepsy has been obtained, but no organic signs have been seen on repeated examination

One may perhaps hazard the speculation that these phenomena represent some disorder of periventricular visceral centres concerned in the regulation of sleep and of fluid interchange, with radiation to other visceral centres situated in the floor of the fourth ventricle

3 Another rather unusual but interesting visceral association is provided by those cases of ordinary epilepsy which appear to have as a regular accompaniment *rise of temperature* I do not here refer to the fever which develops when repeated severe general fits occur, as in status epilepticus, but to individual attacks, separated it may be by long intervals, in which elevation of temperature is found Doubtless some such cases are simply explained by the temporary occurrence of some intestinal toxaemia accountable for both the fit and the fever, yet in other instances the question arises whether the latter may not be of neural origin I have in mind the case of a schoolboy of 16, who for two years had had an occasional epileptic fit, in each instance associated with muscular effort (wrestling, swimming, running, and in the gymnasium), the attack consists of brief loss of consciousness, pallor, and involuntary micturition, without any convulsive movements (tonic or clonic) being in evidence On each occasion the temperature has shot up after the attack to 103° or 104° F, coming down the same day, or the next, as suddenly as it has run up No ready explanation for this occurrence has been discovered, even with the most careful search over the somatic systems At the most, a severe generalized fit will not raise body heat more than half a degree For the above and one or two somewhat similar instances it seems conceivable that a neural (neuro-sympathetic) mechanism is implicated

4 When the semeiology of still other epileptic varieties is carefully scrutinized the fact that they appear to consist of little else than *isolated neuro-sympathetic disturbance* must be allowed The remark is clearly apposite in respect of many examples of petit mal, so-called Cases which the clinician has great difficulty in classifying, the choice lying between "faint" and "fit," belong here Syncopal attacks are in essence visceral, and often indistinguishable from forms of fit, if of circulatory etiology they are considered "faints", if of neural, they are "fits" But here, too, we may be labouring a distinction without a difference An elderly gentleman has suffered from rare major epileptic fits for many years, since he has become slightly arterio-sclerotic they have ceased, but what he calls "sensations" have taken their place These recur nearly every day He was seated in my consulting room and my blood pressure instrument was on his left arm, asked a question about his old school, to my surprise he vouchsafed no reply, grasping the table with his left hand, and the arm of the chair with his right, he sat motionless, turned a greyish colour, and his respiration immediately accelerated in a rapidly rising series of ever shorter and quicker breaths, becoming slower again in about half a minute and the arrhythmia ending with a deep sigh He immediately remarked, "Oh, I was at such and such a school," form, it as though he had not been aware of the fits distinguished thus passed Petit mal, of course, is contracted in rigid epithet but neurally considered, the arms extended and in the case was surely limited to the inverted Here I the floor of the fourth ventricle psychogenesis of the (whether vascular or neural I know there can be no doubt train that transient clouding of from the standpoint of an absence epileptique" Isolated tonic fits attended analogous kinds represents on occasion all that there is of epileptic semeiology

If we could but discover the secret of inhibition and of de-inhibition, if we had some scientific means of reinforcing the former at the moment when escape from control is imminent, could we but determine that switching off of the current which in some patients can be effected by potent stimuli aroused through other channels at the crucial moment, our treatment of epileptic episodes would not be so nugatory as it often proves to be

STREPTOCOCCAL SEPTICAEMIA AND APLASTIC ANAEMIA

CASE REPORT

BY

D A ABERNETHY, M B OXON, F R C S ED,
A G GIBSON, M D, F R C P,
AND
A WATSON RUSSELL, *M C*, M B, CH B

THE patient whose case we record was a girl aged 18, she had never been robust, though she had enjoyed moderately good health The tonsils had been under suspicion owing to a tendency to sore throat On the evening of November 13th, 1929, there occurred pain over the left costal margin The temperature was 104° This kept up and was of the high remittent type when seen by two of us (A W R and A G G) on November 16th Nose bleeding and ulceration of both tonsils had occurred on the 15th She was a well-made girl, well nourished, coughing up blood, which apparently came from the nose She was not unduly anaemic The left cheek had a slightly bluish tinge The pulse was 118, respirations 20, the fingers were not clubbed, the skin was normal in texture and clear of blemish or petechiae, there were no glands to be felt in the neck, axillae, or groins In the chest there was a slight diminution of breath sounds towards the left base behind, but no interference with movement and no signs of fluid There was nothing definite on examination of the abdomen On November 19th the urine contained albumin, blood, and a few casts, with a moderate number of long streptococci The signs in the left side of the chest were unaltered, but the left lumbar region was tender, and, though it was difficult to feel, the kidney appeared to be enlarged The epistaxis continued until November 21st, and the albumin in the urine persisted

On November 25th the temperature was of the high remittent type at the 102° level, and the patient was markedly anaemic The sclerotics were greenish, as was the tint of the skin The left lumbar and hypogastric region was tender, and one small petechial haemorrhage was noticed under the left breast There were no signs of infective endocarditis nor of severe renal disease, and the blood in the urine had disappeared, leaving a trace of albumin only The fever persisted, she became extremely ill with low muttering delirium at times, restlessness, and a return of the epistaxis on November 27th and 30th She was treated by iron (Blaud's pill) and antistreptococcal serum subcutaneous injections each of 10 c.cm., four of which were concentrated serums) on every second day and adrenaline mixture daily On December 5th she was given a

transfusion of blood, 1½ pints, which she stood well though she had a rigor afterwards She vomited on this and the previous day

The progress, despite the transfusion was downward, and on December 10th towards the evening the patient was breathless, anxious, restless, and in the early stages of cardiac failure Adrenaline, which had been given in doses of 10 minims daily since November 27th subcutaneously, was injected every three hours, and Praisse's ferruginous ampoule 1 c.cm was given intramuscularly, the following day the patient was slightly better, though she vomited three times and could not retain enemata of glucose with brandy It was then noticed that she had a number of petechial haemorrhages over the chest Some days before this, on December 4th, the right lobe of thyroid had become enlarged and was slightly painful, but the gland was well defined at this spot and showed no infiltration nor any external signs of haemorrhage On the morning of December 12th her condition was extremely critical She was semiconscious and restless, the respirations were rapid, and she complained of cramp like pains in the legs There was a large ecchymosis under the skin of each heel, surrounded by a flushed area, which looked like incipient gangrene, and there were areas of anaesthesia over the shins As the patient appeared to be dying of anoxaemia a second transfusion was given of 1½ pints of Group II blood

The result of this transfusion was a striking improvement for the following day she had a boiled egg for her breakfast and enjoyed fish for dinner, whereas the previous day (December 11th) she could retain nothing given by the mouth and very little given per rectum The temperature following this transfusion did not rise above 100° and fell to normal by December 27th

On December 24th the thyroidal swelling, which had become general and harder, pointed on the right side, and a fair quantity of pus containing streptococci was evacuated under gas The wound gradually healed under treatment by fomentation

After the second transfusion her colour became natural, though her general aspect was anaemic. From this time on she was given adrenaline and iron, and made progress Rheumatic pains affecting both feet were present in the early days of January On January 7th there was nausea, and on the 8th it persisted and the patient became drowsy Pain appeared in the left loin on January 10th, and continued with rheumatic pains in the leg and knee for several days Nausea also persisted Fever again became evident on January 8th There was tenderness in the left loin, and the left kidney was suspected of causing this tenderness On January 9th the urine contained a trace of albumin, in the deposit were pus cells and others from a transitional membrane, together with some long-chain streptococci On January 21st the urine contained albumose as well as a slight amount of albumin Pain on that day had appeared in the left knee On January 24th she had a bout of pain in the loin, called for the bedpan, and after what appeared to be a spasm passed two small masses of membrane, yellowish in colour, one 2 inches long and 1/3 inch broad, the other elongated, with striations on the surface 1/2 inch by 1/2 inch by 1/8 inch The membrane had the ordinary structure of a pyogenic membrane and contained numerous streptococci, the urine following this attack contained pus The temperature fell to normal on the next day (January 25th), and the pain ceased Frequency of micturition was marked on the 25th and 26th, and the appetite returned on the 27th From that date she made good improvement, the pus and albumin in the urine persisted for nearly a fortnight, but all signs of abnormality, including albumose, had disappeared by February 20th

The Blood Condition

The following are the blood counts made at different stages throughout the illness

			Total No. per c.mm.
November 26th 1929			
Red blood cells 1 450 000	Polymorphs	17%	909
Haemoglobin 24 per cent	S lymphocytes	3·5%	819
Colour index 0.85	L lymphocytes	49%	2621
White blood cells 5 350			

			Total No. per c.mm.
December 5th			
Red blood cells 850 000	Polymorphs	20%	222
Haemoglobin 18 per cent	Lymphocytes	5·5%	663
Colour index 1.1	Endothelials	17%	178
White blood cells 1 040	Mast cells	5%	

Blood platelets very few Nucleated reds present Blood film shows a degree of anisocytosis No gross poikilocytosis or polychromasia Size of red cells 7.32 microns (Eve)

December 5th blood transfusion

December 10th			
Red blood cells 1 170 000	Polymorphs	30%	50
Haemoglobin 24 per cent	Lymphocytes	52%	760
Colour index 1.03	Endothelials	11%	165
White blood cells 1 500	Mast cells	1%	
	Eosinophils	1%	
	Myelocytes	2%	

Four nucleated red cells seen There was little alteration in shape and none in colour of the red cells Platelets were extremely rare

December 12th, second transfusion

December 16th			
Red blood cells 1,330 000	Polymorphs	29%	430
Haemoglobin 30 per cent	Lymphocytes	63%	787
Colour index 1.1	Endothelials	7%	
White blood cells 1 250	Mast cells	1%	

Size of red cells 7.4 microns Slight polychromasia Two nucleated reds per 100 white cells

December 23rd			
Red blood cells 1 640 000	Polymorphs	35%	450
Haemoglobin 32 per cent	Lymphocytes	57%	934
Colour index 1.0	Endothelials	6%	
White blood cells 1 640	Mast cells	1%	

Anisocytosis and poikilocytosis moderate No polychromasia or punctate basophilia seen Platelets present in small numbers One normoblast seen

December 30th.			
Red blood cells 1 900 000	Polymorphs	52%	952
Haemoglobin 40 per cent	Lymphocytes	41%	787
Colour index 1.0	Endothelials	6%	
White blood cells 1 850	Mast cells	1%	

Slight polychromasia and anisocytosis Red cells 7.8 microns

January 5th 1930			
Red blood cells 2 060 000	Polymorphs	35%	937
Haemoglobin 54 per cent	Lymphocytes	50%	1425
Colour index 1.3	Endothelials	14%	793
White blood cells 2 850	Eosinophils	1%	

Size of red cells 7.7 microns Anisocytosis but no poikilocytosis or polychromasia Platelets very few

January 13th			
Red blood cells 2 250,000	Polymorphs	68.5%	2733
Haemoglobin 50 per cent	Lymphocytes	25.5%	1359
Colour index 1.1	Endothelials	5.0%	
White blood cells 5 450	Mast cells	0.5%	
	Myelocytes	0.5%	

Size of red cells 8.30 microns Morphology normal.

January 20th			
Red blood cells 2 620 000	Polymorphs	47%	2209
Haemoglobin 52 per cent	Lymphocytes	31%	1457
Colour index 1.0	Endothelials	21%	987
White blood cells 4 700	Eosinophils	1%	

Size of red cells 7.64 microns

January 27th			
Red blood cells 2,240 000	Polymorphs	52%	
Haemoglobin 50 per cent	Lymphocytes	44%	
Colour index 1.1	Endothelials	4%	
White blood cells 5 200			

Size of red cells 7.64 microns Some poikilocytosis and anisocytosis

February 3rd			
Red blood cells 2,960 000	Polymorphs	48%	2134
Haemoglobin 54 per cent	Lymphocytes	45%	2182
Colour index 1.2	Endothelials	9%	
White blood cells 4 850	Eosinophils	1%	
	Mast cells	1%	

Size of red cells 7.64 microns Some poikilocytosis and anisocytosis

February 10th			1252
Red blood cells 2,900 000	Polymorphs	28%	2584
Haemoglobin 56 per cent	Lymphocytes	61%	
Colour index 0.94	Endothelials	8%	
White blood cells 4 400	Eosinophils	2%	
	Mast cells	1%	

Size of red cells 7.64 microns Slight degree of anisocytosis and poikilocytosis

February 17th.			
Red blood cells 2,620 000	Polymorphs	47%	2115
Haemoglobin 60 per cent	Lymphocytes	44%	1980
Colour index 1.1	Endothelials	9%	
White blood cells 4,500			

Size of red cells 7.64 microns Still slight anisocytosis and polychromasia

			Total No per c mm
February 24th			
Red blood cells 3,240,000	Polymorphs	16%	296
Haemoglobin 68 per cent	Lymphocytes	66%	1221
Colour index 1 0	Endothelials	16%	296
White blood cells 1,850	Eosinophils	1%	
	Mast cells	1%	
Size of red cells, 7 81 microns			
March 3rd			
Red blood cells 3,910,000	Polymorphs	12%	264
Haemoglobin 72 per cent	Lymphocytes	80%	1760
Colour index 0 92	Endothelials	8%	
White blood cells 2,200			

Red cells almost normal in appearance and by Eve's halometer 7 48 microns (normal)

It will be seen that throughout there was a very grave anaemia with a high colour index, reaching on January 5th the figure 1 3 The white count in the most serious part of the illness was very low, and the total polymorph count extremely so The size of the red cells was never enlarged as determined by Eve's halometer, except on one occasion (January 13th), when it was increased and in the pernicious zone The whole gives a picture of serious interference with the bone marrow, but with some evidence of activity of that tissue The interpretation of these counts is that the patient suffered from an aplastic type of anaemia (agranulocytic anaemia) The last blood count, though the patient was apparently convalescent, showed a moderate degree of anaemia of this type

The Cardio-vascular System

The pulse from the early stage of the illness was fast, and was seldom recorded below 100 When the anaemia was most marked in the early days of December it varied about 120 It appeared to be higher after the first transfusion On December 11th the pulse was recorded up to 152, on this day the patient appeared to be dying, she was extremely pale, was breathless (respirations 48), and orthopnoeic Injections of adrenaline chloride 1/1000 of 0 5 c cm at three-hourly intervals caused great relief to the breathing and a lowering of the pulse rate Subsequent to this the injections were repeated thrice daily until December 30th, when they were reduced to two a day It was reduced to once a day on January 7th and discontinued on February 7th

Remarks

The case in one aspect was one of streptococcal septicaemia The illness began with a sore throat Fever persisted altogether in the first instance for twenty-nine days at a high level Though no blood culture was made streptococci were identified as the causal agent of the renal haemorrhage on November 18th Streptococci were the cause of the thyroidal abscess which was opened on December 24th, the same organism was found in the sloughs passed in the urine on January 24th The damage so obvious in the kidney and the thyroid appeared also in the bone marrow, as shown by the nature of the anaemia, the rheumatic pains, and the presence of albumose in the urine

In the matter of therapy only the most important drugs and measures are mentioned The first blood transfusion appeared to have some effect, but the second following the increased dose of adrenaline appeared to act in a marvellous way The action of the adrenaline appeared to serve more as a cardiac stimulant than as a haemopoietic, such as appears to be so clear in a previously published case [1]

As convalescence was established the patient returned to [illegible] home and ceased to be under our observation The [illegible] count, it will be seen, was not normal, and as the [illegible]t is young there is room for hope that some, if not [illegible]te restoration of function of the bone marrow may [illegible]mately ensue It may be mentioned, however, that the patient in the case previously described by one of us [1] still retains the blood count of an aplastic anaemia

Since the above was written the patient, after leading a normal life again suffered from a severe tonsillitis and died after a short illness

THE DIRECT COMPARATIVE DIFFRACTION METHOD OF DEMONSTRATING MEGALOCYTOSIS

BY

J H MALLOY, M B , Ch B ,

CHEADLE, STAFFORDSHIRE

Two noteworthy articles by Pijper [1] and Eve [2] appeared in the literature of the past year describing instruments for the practical application of the diffraction phenomenon to the diagnosis of pernicious anaemia Both instruments show advance in the direction of simplification of necessary apparatus for convenience in clinical use Edwards [3] has described a modification of Pijper's instrument with a simpler form of illumination

The "direct comparative diffraction" method is a further simplification Exhaustive examination of blood films fails to show that it sacrifices efficiency for simplicity For the practical diagnosis and control of the treatment of pernicious anaemia, I have found that the results compare advantageously with those obtained by either Eve's halometer or Edwards's modification of Pijper's "diffraction micrometer" My personal observations have been *controlled and verified by the untutored observation* and discrimination of a large number of individuals of varying intelligence, who merely described what they saw in complete ignorance of the significance of their findings

The only *essential* apparatus is a normal blood film with which to compare films taken from cases suspected of suffering from the disease Any source of artificial light may be used, but candle light is probably best on account of its softness The flame of any small cigarette lighter with an exposed wick gives excellent results and is easily carried

Principle of the Method

The method depends on the following facts If a light is observed through a blood film held close to the eye a diffraction halo is seen which varies in intensity with the thickness of the film and the size, quality, and distance of the light The halo consists of two zones, the inner of which is a yellow disc surrounded by an orange ring The outer zone consists of concentric coloured circles of red, orange, yellow, green, blue, indigo, and violet, from without inwards Interposed between the two zones and actually belonging to the inner one is a red ring, which mingles to a varying degree with the orange and violet For the test this red ring is taken as the dividing line between the two zones

If the light is observed through two blood films one in front of each eye like spectacle lenses, actually only one halo is seen In reality it consists of the superimposed haloes of the two films The production of diplopia separates the haloes and presents them side by side for comparison as to size The haloes for the corresponding films are on the same side as the films The diplopia can be produced by a voluntary internal squint or by placing a prism, such as is found in refraction test cases, in front of one eye with the base to the inner side

The inner zone is the one chosen for comparison By comparison with the halometer and modified micrometer I have found that the central disc varies in size inversely with the average size of the red blood corpuscles It is possible to note variations of 0 1 degree according to Eve's scale The greater the degree of megalocytosis the more accurate is the discrimination Comparatively speaking, the difference in the size of the haloes which would give readings of 4 7 and 4 1 degrees respectively by Eve's scale might be taken as the difference between a halfpenny and a sixpenny piece, 4 3 and 4 1 degrees as the difference between a florin and a halfpenny

Making of Films

Wash the slides with soap and water, rinse thoroughly, dry with a towel and polish with a piece of silk To obtain a drop of blood, pierce the lobe of the ear, which need not be sterilized, with a sterile medium sized surgical needle Squeezing the lobe does not affect the test Take the drop on one end of the slide, allow it to spread along

the edge of another slide, and with the latter push it rapidly towards the other end This gives a film which tapers off in thickness, a condition ideal for the test

To obtain a standard film take drops of blood from several known healthy persons and compare the size of the central zones of their diffraction haloes If no difference in size can be noticed between any of them, any one may be taken as standard

Technique of Test

Hold the standard film between the finger and thumb of one hand and the unknown film in the other Examine the source of light through both separately to find the spot where the halo is seen most clearly Having done this, hold both films close to the eyes with the upper ends of the slides resting against the eyebrows Produce diplopia, and compare the size of the central discs of the separated haloes If a prism is used, fix it to the front of the slide with the finger and thumb, with the base inward , and examine by the method I have described Make sure first that the prism will produce diplopia Whatever method is used the observations should be checked by transposing the slides

Two fallacies may arise which are easily avoided *provided the possibility of their existence is recognized They* only cause confusion when examining slides whose corresponding haloes are practically equal Prolonged gazing at a bright light may cause a variation in the size of the haloes from irritation of the retina It may even be found that the smaller halo remains on the same side when the slides are transposed The remedy is to use a soft light and to carry out the examination as expeditiously as is compatible with accuracy The soft light of a candle is best, and I always use it in finally deciding doubtful cases

If the voluntary internal squint is used, too long continuance of it may result in changes in the size of the haloes This is due to unequal spasm of accommodation, and is most likely to occur if the light is brilliant and the operator unpractised Only those who can produce diplopia readily should use the squint method To correct the error rest the eyes for a few moments and examine the film again If in doubt use candle-light

Value of the Test

According to the observations of Price-Jones and Hurst an increase in the size of the red blood corpuscles is a constant feature of pernicious anaemia The "direct comparative diffraction" method shows this change, if present, by allowing of the comparison of unknown blood films with normal blood films The accuracy of the test depends on the finding of A. Pijper that the diffraction halo produced by passing a beam of light through a blood film varies in size inversely with the average diameter of the red blood corpuscles

Application of the Method

The presence of symptoms suggestive of pernicious anaemia and spinal cord degeneration calls for its use, as also do the symptoms classified under pre-pernicious anaemia described by Eve Marked positive results are diagnostic Negative results accompanied by strongly suggestive symptoms of "pre-pernicious anaemia" must be followed by very thorough physical examination, including a test meal for achlorhydria, examination of stools for occult blood, ova, etc Failure to follow this *last rule suggests a compromise between a desire for early* diagnosis and a disinclination to follow the desire to a logical conclusion

Prophylaxis

The inclusion of "pre pernicious anaemia"[2] with pernicious anaemia under the heading of "megalocytic anaemia" appears to me confusing Pre-pernicious anaemia by its very definition is not accompanied by anaemia Also from the point of view of the pathogenesis of the condition the term as applied by Eve is misleading Hurst[4] has shown that the primary condition is achlorhydria, which allows of infection of the duodenum by a haemolytic streptococcus This appears to be the starting point from which the toxin is produced Absorption of this toxin eventually results in the changes in the body which are recognized as pernicious anaemia It would seem to be more helpful to call the interval between infection and the onset of anaemia the incubation period of pernicious anaemia

If this view is taken the scope of prophylaxis is extended *A negative result of examination for megalocytosis*, if accompanied by achlorhydria should be followed by removal of all septic foci and treatment by hydrochloric acid The patient should be told of the possibilities of the condition and instructed to attend every month for blood examination I am at present treating a patient on these lines with very satisfactory results I have impressed on her the importance of seeking advice immediately on the reappearance of symptoms If megalocytosis is found, liver treatment must be given

Control of Treatment

Once treatment has been commenced this method may be used as a check on any improvement Blood films should be taken every fortnight and marked with name and date Each new blood film should be compared with the standard and as many of the previous films as are necessary to check whether the condition is stationary improving, or retrogressing The slides can be safely kept between succeeding folds of white paper

Comparison with Other Methods

The disadvantages of this method are more numerous in theory than they are real in actual practice It might be argued that slight differences in the average diameter of the red blood corpuscles—say 0 05 μ—would not produce differences in the size of the haloes easily discernible to the eye Even if this is literally true, it by no means diminishes the value of the method On the contrary it enhances it because the absence of a sharp dividing line between normocytosis and megalocytosis renders such delicate differentiations valueless and misleading in diagnosis

With regard to delicacy of differentiation in the observation of any increase or decrease in the size of the corpuscles it compares very favourably with Eve's halometer I have not found that different observers, even with practice get constant results with the same slides in the use of this instrument This is due to the fact that as the haloes are approximated the arcs in the red circle cut off by the green circles of the overlapping outer zones become more and more indistinct, making the points of contact, to say the least arbitrary This is easily made out by pushing the knob along the slide till the red circles are almost in contact and comparing the clearness of the red at the inner and outer poles

The modification of Pijper's diffraction micrometer described by Edwards is open to several objections Very slight faults in construction—for example, errors in alignment of the partition—give erroneous results The flash-lamp bulbs which may be used for the light may give distorted haloes, so much do they vary in their filaments and in the shape of their glass bulbs Slight variations in the focusing of the lenses may result in the formation of incomplete semicircles which are useless for differentiation Films which can easily be differentiated by the "direct comparative diffraction" method, may give results with this instrument the interpretation of which is largely open to questions of opinion

The method I have described possesses the *following* advantages The necessary impedimenta are *easily carried* They consist of three glass slides one with a standard blood film, one glass prism, unnecessary if the user can produce voluntary diplopia easily one small pocket cigarette lighter, also unnecessary as the candle is ubiquitous, one medium-sized surgical needle a small piece of cotton-wool to stop bleeding if necessary All these can be carried in a small cigarette case Mechanical breakdown is impossible There are none of the difficulties which are constantly associated with electric lighting

If it is remembered that (1) variations in size of the haloes which might be considered equivocal constitute a negative result, (2) equivocal observations must be followed by a test meal if the suspicions of pernicious anaemia in any of its stages are strong, this method has nothing to lose by comparison with instrumental methods of measuring megalocytosis

			Total No per c mm
February 24th			
Red blood cells 3,240,000	Polymorphs	16%	236
Haemoglobin 68 per cent	Lymphocytes	66%	1221
Colour index 1 0	Endothelials	16%	296
White blood cells 1,850	Eosinophils	1%	
	Mast cells	1%	
Size of red cells, 7 81 microns			
March 3rd			
Red blood cells 3,910,000	Polymorphs	12%	264
Haemoglobin 72 per cent	Lymphocytes	80%	1760
Colour index 0 92	Endothelials	8%	
White blood cells 2,200			

Red cells almost normal in appearance and by Eve's *halometer* 7 48 microns (normal)

It will be seen that throughout there was a very grave anaemia with a high colour index, reaching on January 5th the figure 1 3 The white count in the most serious part of the illness was very low, and the total polymorph count extremely so The size of the red cells was never enlarged as determined by Eve's halometer, except on one occasion (January 13th), when it was increased and in the pernicious zone The whole gives a picture of serious interference with the bone marrow, but with some evidence of activity of that tissue The interpretation of these counts is that the patient suffered from an aplastic type of anaemia (agranulocytic anaemia) The last blood count, though the patient was apparently convalescent, *showed a moderate* degree of anaemia of this type

The Cardio-vascular System

The pulse from the early stage of the illness was fast, and was seldom recorded below 100 When the anaemia was most marked in the early days of December it varied about 120 It appeared to be higher after the first transfusion On December 11th the pulse was recorded up to 152, on this day the patient appeared to be dying, she was extremely pale, was breathless (respirations 48), and orthopnoeic Injections of adrenaline chloride 1/1000 of 0 5 c cm at *three-hourly intervals* caused great relief to the breathing and a lowering of the pulse rate Subsequent to this the injections were repeated thrice daily until December 30th, when they were reduced to two a day It was reduced to once a day on January 7th and discontinued on February 7th

Remarks

The case in one aspect was one of streptococcal septicaemia The illness began with a sore throat Fever persisted altogether in the first instance for twenty-nine days at a high level Though no blood culture was made streptococci were identified as the causal agent of the renal haemorrhage on November 19th Streptococci were the cause of the thyroidal abscess which was opened on December 24th, the same organism was found in the sloughs passed in the urine on January 24th The damage so obvious in the kidney and the thyroid appeared also in the bone marrow, as shown by the nature of the anaemia, the rheumatic pains, and the presence of albumose in the urine

In the matter of therapy only the most important drugs and measures are mentioned The first blood transfusion appeared to have some effect, but the second following the increased dose of adrenaline appeared to act in a marvellous way The action of the adrenaline appeared to serve more as a cardiac stimulant than as a haemopoietic, such as appears to be so clear in a previously published case [1]

As convalescence was established the patient returned to her home and ceased to be under our observation The blood count, it will be seen, was not normal, and as the patient is young there is room for hope that some, if not complete restoration of function of the bone marrow may ultimately ensue It may be mentioned, however, that the patient in the case previously described by one of us [1] still returns the blood count of an aplastic anaemia

Since the above was written the patient, after leading a normal life again suffered from a severe tonsillitis and died after a short illness

THE DIRECT COMPARATIVE DIFFRACTION METHOD OF DEMONSTRATING MEGALOCYTOSIS

BY

J H MALLOY, M B, Ch B,

CHEADLE, STAFFORDSHIRE

Two noteworthy articles by Pijper[1] and Eve[2] appeared in the *literature of the past year describing instruments* for the practical application of the diffraction phenomenon to the diagnosis of pernicious anaemia Both instruments show advance in the direction of simplification of necessary apparatus for convenience in clinical use Edwards[3] has described a modification of Pijper's instrument with a simpler form of illumination

The "direct comparative diffraction" method is a further simplification Exhaustive examination of blood films fails to show that it sacrifices efficiency for simplicity For the practical diagnosis and control of the treatment of pernicious anaemia, I have found that the results compare advantageously with those obtained by either Eve's halometer or Edwards's modification of Pijper's "diffraction micrometer" My personal observations have been controlled and verified by the untutored observation and discrimination of a large number of individuals of varying intelligence, who merely described what they saw in complete ignorance of the significance of their findings

The only *essential* apparatus is a normal blood film with which to compare films taken from cases suspected of suffering from the disease Any source of artificial light may be used, but candle light is probably best on account of its softness The flame of any small cigarette lighter with an exposed wick gives excellent results and is easily carried

Principle of the Method

The method depends on the following facts If a light is observed through a blood film held close to the eye a diffraction halo is seen which varies in intensity with the thickness of the film and the size, quality, and distance of the light The halo consists of two zones, *the inner of* which is a yellow disc surrounded by an orange ring The outer *zone consists of concentric coloured circles* of red, orange, yellow, green, blue, indigo, and violet, from without inwards Interposed between the two zones and actually belonging to the inner one is a *red ring, which* mingles to a varying degree with the orange and violet For the test this red ring is taken as the dividing line between the two zones

If the light is observed through two blood films, one in front of each eye like spectacle lenses, actually only one halo is seen In reality it consists of the superimposed haloes of the two films The production of diplopia separates the haloes and presents them side by side for comparison as to size The haloes for the corresponding films are on the same side as the films The diplopia can be produced by a voluntary internal squint or by placing a prism, such as is found in refraction test cases, in front of one eye with the base to the inner side

The inner zone is the one chosen for comparison By comparison with the halometer and modified micrometer I have found that the central disc varies in size inversely with the average size of the red blood corpuscles It is possible to note variations of 0 1 degree according to Eve's scale The greater the degree of megalocytosis the more accurate is the discrimination Comparatively speaking, the difference in the size of the haloes which would give readings of 4 7 and 4 1 degrees respectively by Eve's scale might be taken as the difference between a halfpenny and a sixpenny piece, 4 3 and 4 1 degrees as the difference between a florin and a halfpenny

Making of Films

Wash the slides with soap and water, rinse thoroughly, dry with a towel and polish with a piece of silk To obtain a drop of blood, pierce the lobe of the ear, which need not be sterilized, with a sterile medium-sized surgical needle Squeezing the lobe does not affect the test Take the drop on one end of the slide, allow it to spread along

the edge of another slide, and with the latter push it rapidly towards the other end This gives a film which tapers off in thickness a condition ideal for the test

To obtain a standard film take drops of blood from several known healthy persons and compare the size of the central zones of their diffraction haloes If no difference in size can be noticed between any of them, any one may be taken as standard

Technique of Test

Hold the standard film between the finger and thumb of one hand and the unknown film in the other Examine the source of light through both separately to find the spot where the halo is seen most clearly Having done this, hold both films close to the eyes with the upper ends of the slides resting against the eyebrows Produce diplopia, and compare the size of the central discs of the separated haloes If a prism is used, fix it to the front of the slide with the finger and thumb, with the base inwards, and examine by the method I have described Make sure first that the prism will produce diplopia Whatever method is used the observations should be checked by transposing the slides

Two fallacies may arise which are easily avoided provided the possibility of their existence is recognized They only cause confusion when examining slides whose corresponding haloes are practically equal Prolonged gazing at a bright light may cause a variation in the size of the haloes from irritation of the retina It may even be found that the smaller halo remains on the same side when the slides are transposed The remedy is to use a soft light and to carry out the examination as expeditiously as is compatible with accuracy The soft light of a candle is best, and I always use it in finally deciding doubtful cases

If the voluntary internal squint is used, too long continuance of it may result in changes in the size of the haloes This is due to unequal spasm of accommodation, and is most likely to occur if the light is brilliant and the operator unpractised Only those who can produce diplopia readily should use the squint method To correct the error rest the eyes for a few moments and examine the film again If in doubt use candle-light

Value of the Test

According to the observations of Price Jones and Hurst an increase in the size of the red blood corpuscles is a constant feature of pernicious anaemia The "direct comparative diffraction" method shows this change, if present, by allowing of the comparison of unknown blood films with normal blood films The accuracy of the test depends on the finding of A. Pijper that the diffraction halo produced by passing a beam of light through a blood film varies in size inversely with the average diameter of the red blood corpuscles

Application of the Method

The presence of symptoms suggestive of pernicious anaemia and spinal cord degeneration calls for its use, as also do the symptoms classified under pre-pernicious anaemia described by Eve Marked positive results are diagnostic Negative results accompanied by strongly suggestive symptoms of "pre-pernicious anaemia" must be followed by very thorough physical examination, including a test meal for achlorhydria, examination of stools for occult blood, ova, etc Failure to follow this last rule suggests a compromise between a desire for early diagnosis and a disinclination to follow the desire to a logical conclusion

Prophylaxis

The inclusion of "pre-pernicious anaemia"[2] with pernicious anaemia under the heading of "megalocytic anaemia" appears to me confusing Pre-pernicious anaemia by its very definition is not accompanied by anaemia Also from the point of view of the pathogenesis of the condition the term as applied by Eve is misleading Hurst[4] has shown that the primary condition is achlorhydria, which allows of infection of the duodenum by a haemolytic streptococcus This appears to be the starting point from which the toxin is produced Absorption of this toxin eventually results in the changes in the body which are recognized as pernicious anaemia It would seem to be more helpful to call the interval between infection and the onset of anaemia the incubation period of pernicious anaemia

If this view is taken the scope of prophylaxis is extended A negative result of examination for megalocytosis, if accompanied by achlorhydria should be followed by removal of all septic foci and treatment by hydrochloric acid The patient should be told of the possibilities of the condition and instructed to attend every month for blood examination I am at present treating a patient on these lines with very satisfactory results I have impressed on her the importance of seeking advice immediately on the reappearance of symptoms If megalocytosis is found, liver treatment must be given

Control of Treatment

Once treatment has been commenced this method may be used as a check on any improvement Blood films should be taken every fortnight and marked with name and date Each new blood film should be compared with the standard and as many of the previous films as are necessary to check whether the condition is stationary improving, or retrogressing The slides can be safely kept between succeeding folds of white paper

Comparison with Other Methods

The disadvantages of this method are more numerous in theory than they are real in actual practice It might be argued that slight differences in the average diameter of the red blood corpuscles—say 0·05 μ—would not produce differences in the size of the haloes easily discernible to the eye Even if this is literally true, it by no means diminishes the value of the method On the contrary it enhances it because the absence of a sharp dividing line between normocytosis and megalocytosis renders such delicate differentiations valueless and misleading in diagnosis

With regard to delicacy of differentiation in the observation of any increase or decrease in the size of the corpuscles it compares very favourably with Eve's halometer I have not found that different observers, even with practice, get constant results with the same slides in the use of this instrument This is due to the fact that as the haloes are approximated the arcs in the red circle cut off by the green circles of the overlapping outer zones become more and more indistinct, making the points of contact, to say the least arbitrary This is easily made out by pushing the knob along the slide till the red circles are almost in contact and comparing the clearness of the red at the inner and outer poles

The modification of Pijper's diffraction micrometer described by Edwards is open to several objections Very slight faults in construction—for example, errors in alignment of the partition—give erroneous results The flash-lamp bulbs which may be used for the light may give distorted haloes, so much do they vary in their filaments and in the shape of their glass bulbs Slight variations in the focusing of the lenses may result in the formation of incomplete semicircles which are useless for differentiation Films which can easily be differentiated by the "direct comparative diffraction" method, may give results with this instrument the interpretation of which is largely open to questions of opinion.

The method I have described possesses the following advantages The necessary impedimenta are easily carried They consist of three glass slides, one with a standard blood film, one glass prism, unnecessary if the user can produce voluntary diplopia easily, one small pocket cigarette lighter, also unnecessary as the candle is ubiquitous, one medium-sized surgical needle a small piece of cotton-wool to stop bleeding if necessary All these can be carried in a small cigarette case Mechanical breakdown is impossible There are none of the difficulties which are constantly associated with electric lighting

If it is remembered that (1) variations in size of the haloes which might be considered equivocal constitute a negative result, (2) equivocal observations must be followed by a test meal if the suspicions of pernicious anaemia in any of its stages are strong, this method has nothing to lose by comparison with instrumental methods of measuring megalocytosis

Conclusion

Since no fixed boundary line can be determined between normal and abnormal size of the red blood corpuscles for any given individual, I think that the regular comparison of blood films in suspicious cases of pernicious anaemia is of much greater value than attempting to fix a definite point judged by any scale on any instrument Therefore I submit as worthy of consideration the value of the "direct comparative diffraction" method of observing the onset and progress of any increase in the size of the red blood corpuscles, which has been shown to be diagnostic of pernicious anaemia and the blood changes of subacute combined degeneration of the spinal cord

MEASUREMENT OF THE DISTRIBUTION OF GAMMA RAYS AROUND A FOUR-GRAM MASS OF RADIUM

REPORT FROM THE PHYSICS DEPARTMENT, WESTMINSTER HOSPITAL,

BY

H T FLINT, D Sc, PH D, M R C S, L R C P,

AND

L G GRIMMETT, B Sc

THIS paper describes an attempt to measure accurately the gamma radiation field, in air, of the radium "bomb" in use at Westminster Hospital Annexe The bomb is shown, in section only, in Fig 3, four separate grams of

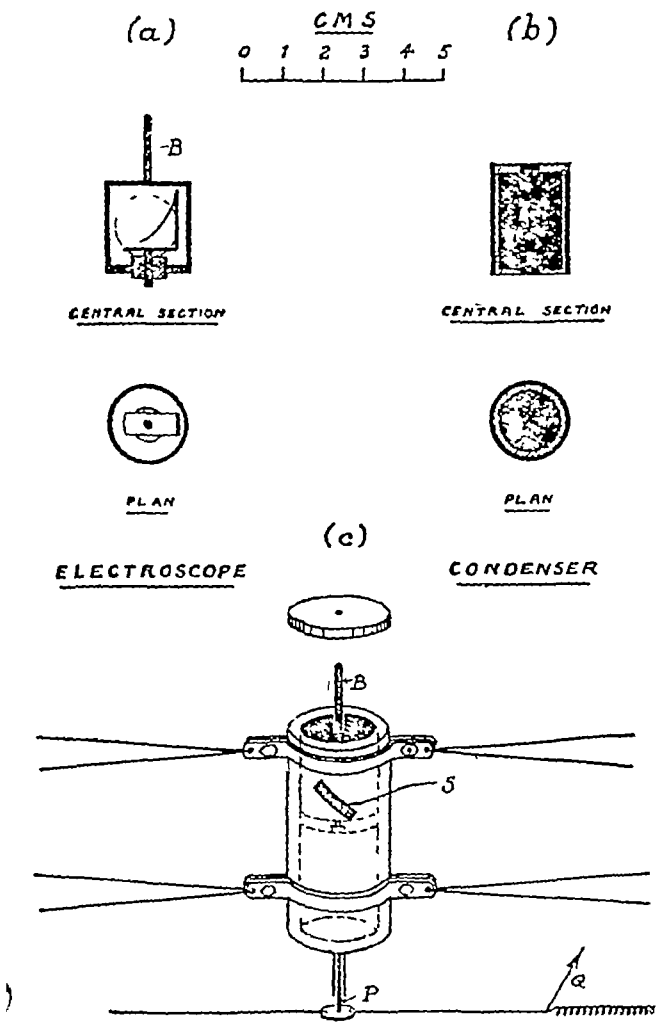

FIG 1

radium were placed one at each corner of a 4 inch horizontal square and so disposed in a lead container* that the issuing radiation was confined to two fairly narrow beams one above and the other below the container

An ionization method was chosen for investigating the field A few preliminary trials with the usual type of apparatus—namely, a small exploring ionization chamber connected by a long wire to a distant electroscope—led us to believe that many difficulties would be avoided at the outset by combining ionization chamber and electroscope into one small instrument, thereby dispensing with connecting leads altogether It is, for example, impracticable to use lead screening to prevent ionization losses from the connecting wire on account of the thickness required the alternative plan of embedding the wire in paraffin wax gives trouble from the static charging-up of the insulation immediately round the wire when exposed to the radiations The capacity of such a connexion also becomes undesirably large compared with that of the ionization chamber

Accordingly, a tiny gold leaf electroscope was made up as shown in Fig 1 (*a*) The leaf was attached to a brass plate 15 by 6 mm, which was mounted on a sulphur plug, and encased by a thin brass cylinder of radius 10 mm and length 20 mm, furnished with a transparent circular window back and front To slow down the movements of the gold leaf to a measurable rate in the intense fields which were being dealt with it was found necessary to add in parallel with the electroscope a small condenser consisting of two co-axial brass cylinders separated by a thin film of sealing-wax (Fig 1 (*b*)), whose electrostatic capacity was of the same order as that of the electroscope itself

To ward off stray beta rays the electroscope and con-

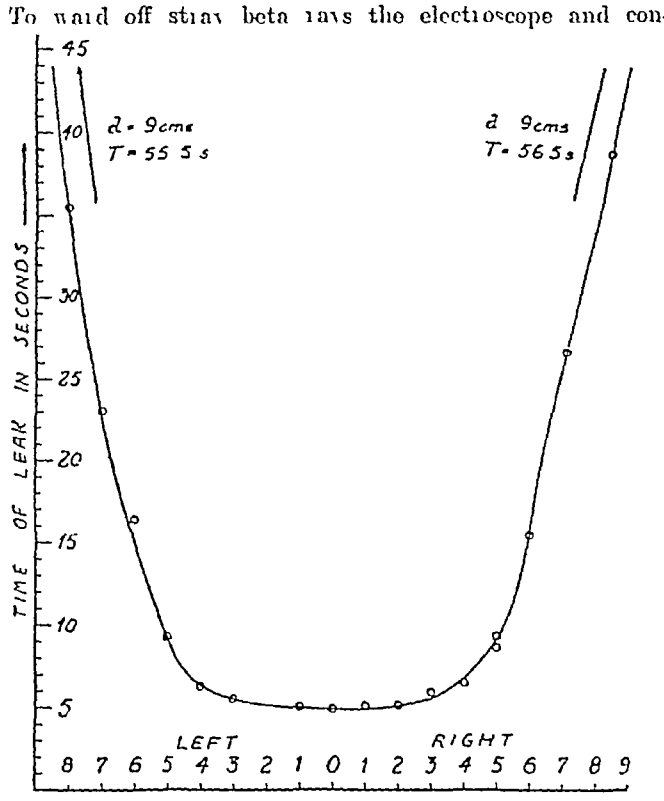

FIG 2.

denser were assembled one above the other in a cylindrical lead sheath 3 mm thick (Fig 1 (*c*)) which was closed by a circular disc of lead 3 mm thick this was located in position by the spike B fixed to the top of the electroscope, the spike also served to indicate the middle of the instrument The only beta rays which could enter the ionization chamber directly were those which passed in through the narrow diagonal viewing slots S

In order that scattered radiation from the electroscope supports might be reduced to a minimum, the lead sheath

* For a complete account of the bomb see an article on Radium Therapy by Ernest Rock Carling in the *British Medical Journal* of February 8th 1930 (p 232)

and contents were slung on thin steel wires at the centre of an opening 1 metre square, in a light wooden framework, braced with steel wires, which carried at one end a lamp for illuminating the leaf and at the other a telescope for viewing the leaf at a safe distance of 2 metres

The radium container was too heavy to move about with ease, therefore wheels were fitted to the framework so that it would run on a horizontal rail at each end, each rail being adjustable for height The electroscope could thus be placed in any desired part of the field and its position recorded by means of horizontal and vertical scales attached to the framework

The gold leaf system could be connected to a battery of 230 volts by lifting the metal plunger P into contact with the condenser by pulling on a string Q at the operator's end The plunger was earthed to the electroscope case during measurements

The relative gamma-ray intensities at various points were determined by timing the fall of the gold leaf over a fixed interval in the eye-piece scale, which corresponded to a potential change in leaf and condenser of from 228 to 142 volts The accompanying table gives a typical set of readings taken along a horizontal line 4 cm below the bomb, and intersecting its vertical axis Fig 2 shows the same data in graphic form.

Distance (in cm) to left of centre	9	8	7	6	5	4	3	1	0
Time of leak (seconds)	55.5	35.5	23.0	16.3	9.2	6.2	5.-	4.9	4.3

Distance (in cm.) to right of centre	1	2	3	4	5	6	7	8	9
Time of leak (seconds)	5 0	5 0	5 8	6 4	8.5	15.3	25.6	3 7	56.5

Further series of measurements were taken at different levels, in all about 500 readings, covering a vertical area 25 by 20 cm each series giving a curve of the same general character as that of Fig 2

The strongest field observed corresponding to a time of leak of 5 seconds, was taken as 100 in arbitrary units of intensity The isometric lines (curves of equal times of leak, "isodoses") for 100, 95, 90, etc, arbitrary units were drawn by linking up the points on the various levels for which the times of leak were 5 sec, 5 26 sec 5 55 sec, etc, these numbers being inversely proportional to 100, 95, 90, etc Fig 3 shows, on a reduced scale, the gamma-ray isometrics taken in a vertical diametral plane parallel to the bomb supports, it is accurate on the whole to within 5 per cent The chart enables skin doses to be read off in arbitrary units

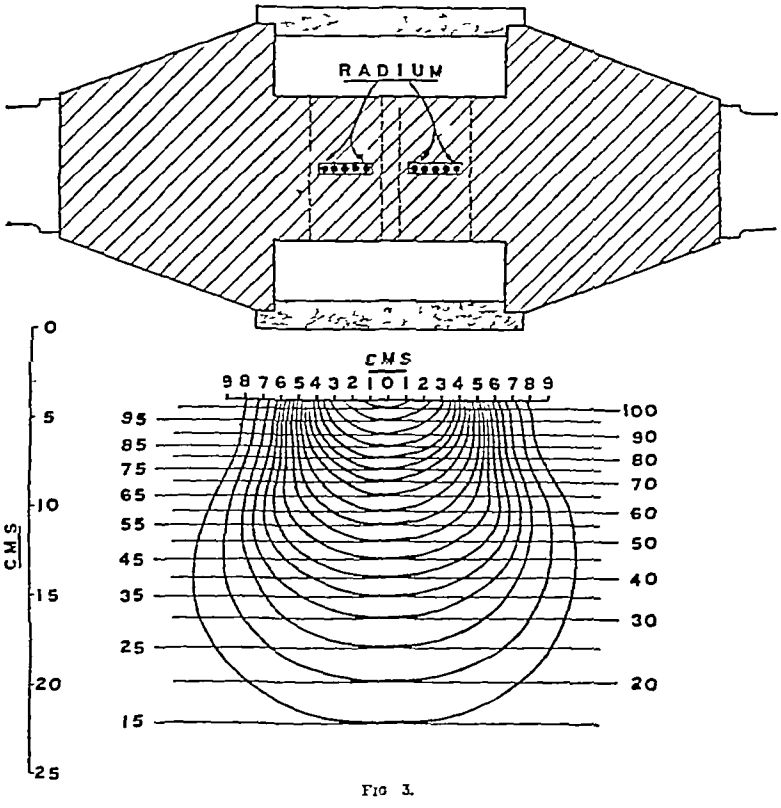

FIG 3.

At the present time there is no general agreement as to the best absolute unit to be used in connexion with the measurement of dosage in gamma-ray therapy Various units have been employed in radiation therapy, and two of these which could be applied to this work are the international R unit and the absorption unit (energy absorbed per cubic centimetre per milligram hour) The calculation of the dose in terms of these units is not without difficulty, especially in the case of the R unit The electrostatic capacity of our measuring instrument has been determined by direct substitution in an oscillating circuit, which completes the data required for computing the total charge set free per second in the ionization chamber but in order to separate the wall effect from the true gas ionization effect by means of which the R unit is defined much further research is necessary

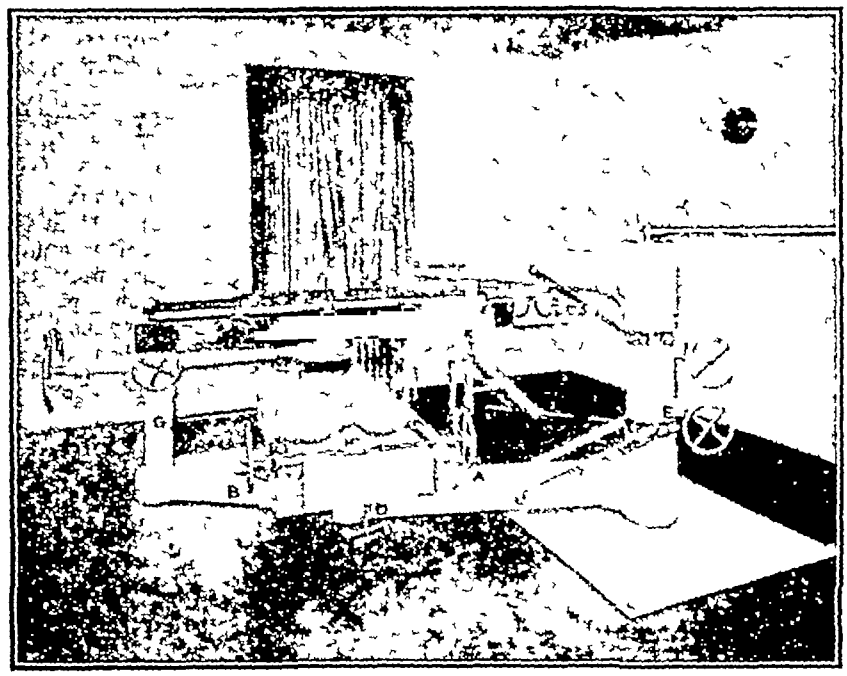
The arbitrary units adopted here form the basis of an accurate measurement of the dose given in any case, and it will be possible to convert them to whatever scientific unit is ultimately adopted in work of this kind The depth dose in the tissue may be expected to differ somewhat from that indicated on the chart by reason of scattering and absorption

It is interesting to note in passing how clearly the lateral bulges of the isometrics mark the boundary of the geometrical shadow cast by the lead tunnels which confine the radium Evidently the spreading of the field may be controlled by altering the depth of the lead channel

LATEST MODIFICATION OF WESTMINSTER TELETHERAPY APPARATUS

BY

FRANCIS ROCK CARLING, B Sc,



LATE TECHNICAL ADVISER RADIUM DEPARTMENT WESTMINSTER HOSPITAL.

THE apparatus to be described was designed to enable those engaged in the treatment of patients to perform their work more safely and easily

Two patients can be treated simultaneously, one above the radium, the other beneath it The bomb itself is designed to tilt only about one axis, so placed that the direct radiation cannot enter the main building, the directions being either towards the sky and ground, or the garden and the road which are safe by reason of distance Thus the necessity for protecting the main building is largely removed In order, however, to err on the side of over-precaution, barium plaster was added to a 24-inch wall Each stretcher can be so approached to the bomb that the axis of tilt of the latter is either parallel to the stretcher or at right angles to it Each stretcher can also be raised or lowered, tilted about its long axis, and traversed longitudinally or laterally Thus the radiation from the bomb can be brought to any position on a patient with the minimum of inconvenience All the movements

can be accomplished with but slight physical effort The controls are placed at the end of the stretcher, which is remote from the radium, so that the operator may adjust the patients, while himself being not only out of the field of radiation but at a considerable distance from it In the same way the bomb controls are placed sufficiently far from the radium for adjustment to be effected without exposure to the radium

It may be mentioned for the sake of those who are interested in technicalities of design that, in spite of the substantial appearance, the maximum stress normally occurring in the hollow wooden beams of the stretchers amounts to 500 lb to the square inch in tension and 300 lb in compression The maximum normal stresses in the steelwork are 10,000 lb to the square inch, in the non-corrosive aluminium castings 5,000 lb, and the maximum bronze-bearing pressures 1,000 lb to the square inch In the case of a suddenly applied load (patient) these stresses may be momentarily doubled

The procedure in putting a patient into position is as follows The appropriate stretcher is pushed round until it occupies a position near the door (in the photograph this is near the foreground) Here the patient is either lifted on to the stretcher or, if able, mounts into position by a convenient pair of steps Then the patient is made comfortable and the exact situation of the lesion located The stretcher is then pushed into the approximately correct position The height is adjusted by the wheel A, the tilt by the wheel B Longitudinal and lateral adjustment requires only a slight pressure of the hand to push the stretcher as desired The position can then be fixed by adjusting the clamps D and E The desired tilt of the bomb is effected by the wheel C Once the patient is correctly adjusted the radium is moved from its shielded position into its working position by means of the lever F

The bomb itself consists of a circular lead block some 17 inches in diameter and 5 inches in thickness It is slung in an aluminium casting round its circumference, which is in turn attached to the steel beam supporting it The beam rotates in ball bearings in the head of the stand G In the centre of the lead is a hole passing through it some 8 inches in diameter Into this from either side are screwed lead annuli of desired dimensions, so that an opening from 4 to 6 inches in diameter can be obtained The radium, in 20 tubes, can be moved radially into this hole by means of a Bowden cable terminating in the handle F Thus the tubes are always disposed in a circle, the diameter of which can be varied at will An investigation of the field from this arrangement of radium is now in the process of being performed The preceding article by Dr Flint and Mr Grimmett describes the field from the "bomb" illustrated in the *Journal* of February 8th, 1930

FATAL DERMATITIS FOLLOWING THE USE OF IODINE SPIRIT SOLUTION

BY

R CHARLES ALEXANDER, M B, CH B, F R C S ED,

SURGEON, ROYAL INFIRMARY DUNDEE, LECTURER IN CLINICAL SURGERY, UNIVERSITY OF ST ANDREWS

For some twenty years solutions of iodine in spirit of varying strength up to 5 per cent have been in use for the preparation of the skin preliminary to surgical operation While a certain amount of skin irritation has been noted in a few cases, there would seem to be no record of a fatality occurring from the use of such a solution, and an account of the course of a case where death followed its use seems worthy of publication

A married woman, aged 37 was admitted to my wards in Dundee Royal Infirmary, on the recommendation of Dr G F Whyte, for the radical cure of a femoral hernia There was nothing unusual in the clinical features of the case, or in the account given by the patient of her previous health Fifteen years previously she had been operated on by another surgeon for acute appendicitis but no information is available as to the method of skin preparation employed at that time

The routine skin preparation then employed in my clinic was that on the day previous to operation the skin of the operation area was shaved the part was washed with ethereal soap and water, dried with a sterile towel painted with surgical spirit, and when that had dried it was painted with a 2½ per cent solution of iodine in spirit When this had dried the part was covered with a sterile dressing retained in place by a bandage, this preparatory dressing being removed on the operating table after anæsthesia had been induced and just before the final preparation of the operation area, which in a clean case, consists of the application of a single coat of the 2½ per cent iodine solution with a gauze pad held in forceps by the surgeon or assistant The solution kept in the theatre for this purpose is stored in a coloured glass bottle with a glass stopper, sufficient for use in each case is poured into a sterile enamel dish a fresh supply being employed for each patient, and no other iodine solution being kept in the theatre At the conclusion of the operation the area is again painted with the solution, a sterile dressing of gauze and cotton wool is applied and retained in place with a domette bandage

The solution used is a 2½ per cent solution of *resublimed* iodine in pure industrial alcohol A small quantity of chloroform, in the proportion of one fluid drachm to four fluid ounces, is added to the iodine solution to prevent the evolution of the irritating iodine vapour so common to alcoholic solutions of iodine Industrial alcohol (the industrial methylated spirits supplied for hospital and special pharmaceutical purposes) is a mixture of plain spirit with 5 per cent of its volume of methyl alcohol, and is preferable to the mineralized spirit since it contains no pyridine or methyl violet and less methyl alcohol

In the case under review nothing unusual was observed in the appearance of the skin at the time of operation The solution employed in the wards and in the theatre for the preparation of the patient was used in several other cases without untoward effects

The first sign of anything being amiss was observed on the day following the operation, when the patient complained of an intense irritation in the region of the wound On examination the whole area prepared for the operation was found covered with an erythema with a few pustular spots A mild boric dressing was applied, and, since this failed to give relief the application of 10 per cent ichthyol in glycerin was tried On the following day the temperature rose to 103°, the erythema being intense and almost plum-coloured, with white spots scattered over the whole area The pulse rate was 140, and the heart was found to be slightly enlarged with soft systolic bruits in all areas There were no abnormal physical signs in the lungs or abdomen, urine was freely passed, and the bowels moved normally There was

slight delirium The white blood cell count was 12 800 per c.mm On the third day after the operation delirium was well established and the pulse became imperceptible On the advice of Dr F M Milne dermatologist to the Infirmary sodium thiosulphate in 5 per cent aqueous solution was applied to the affected area, with the result that the erythema disappeared in a few hours The patient died seventy two hours after the operation with cardiac failure and delirium as the terminal features

Since the certificate of death stated that the cause was 'iodine poisoning' the case had to be reported to the Procurator Fiscal for inquiry The authorities accepted our medical report as fully explaining the reason for the patient's death and did not order a post mortem examination and, as we were unable to obtain permission from the relatives the exact pathological changes could not be determined

Comment

It comes as a shock to a surgeon when any commonly practised procedure has an unexpected fatal issue, and a careful investigation followed into the circumstances of the case Inquiry was made as to possible idiosyncrasy, and it appeared that there were grounds for suspecting this, in that, when on holiday in Aberdeen at one time, the patient had been supplied by a chemist with iodine (in what strength of solution we could not ascertain) for the treatment of an abrasion on the toe, and that its application was followed by a severe local reaction The actual solutions used in the preparation of this patient were used for other patients without ill effect, and there was no departure from the routine preparation already described It was possible that the strength of iodine solution standing in an open vessel in the warm atmosphere of an operating theatre might have been increased by evaporation This had been guarded against by the use in each case of a supply freshly poured from a stoppered bottle Milder forms of dermatitis appear sometimes to be caused by the use of water to clean e blood from the skin surrounding the area of the wound after the completion of the operation Aqueous solutions of iodine are more irritant to the tissues than alcoholic solutions, this being noted when catgut prepared in aqueous iodine solution is used for ligatures, as it seems to favour the production of serum in the wounds Should any cleansing of the skin round the wound be required after operation spirit or ether should be employed

It would appear, therefore, that in this case there was a definite and pronounced individual idiosyncrasy to iodine The actual cause of death was apparently analogous to that in superficial burns from the absorption of toxic products of skin destruction An interesting feature of the case was the immediate relief to the irritation given by the application of sodium thiosulphate

Even an exceptional case like this has caused me to review the method of skin preparation preliminary to operation, and I have adopted with success a 1 per cent solution of iodine in carbon tetrachloride Over a period of some months only one patient has shown any trace of skin irritation For many years I used a 3 per cent solution of picric acid in spirit and its penetrating power appeared to be great, but the occurrence of dermatitis in a series of cases led me to abandon it

Memoranda:

MEDICAL, SURGICAL, OBSTETRICAL

EMBOLISM OF THE ABDOMINAL AORTA

In view of a case recently published in the *British Medical Journal* (November 30th, 1929, p 1002) I think the following one of a very similar nature is worthy of publication

A widow, aged 54 had suffered from chorea at the age of 10 Beyond this no other details are available. For many years she had suffered from rheumatism but had had no acute attacks In time she complained of shortness of breath and had been treated for auricular fibrillation and myocarditis for some years For the past six months she had had attacks of acute pain over the precordium radiating to the left shoulder and arm With treatment these attacks gradually subsided and I did not see her for about two months. She then sent for me complaining of acute pain in the lower central abdomen radiating down both thighs to a little below the knees The onset had been sudden and was associated with loss of power and coldness in both lower extremities When I saw her three hours after the onset she was sitting up in bed very distressed, cyanosed gasping for breath and continually clutching at her legs Her heart was fibrillating, with an apical rate of 110 per minute and there was a systolic apical murmur Her feet were cold but the legs were still warm, and very pale as were also the thighs No peripheral pulse could be felt. She could then bend her knees, but had no movement at the ankle-joint Power at the hip-joint was still present and she could raise her knees off the bed The plantar reflexes and knee-jerks were feebly elicited, but no ankle reflexes could be obtained.

She was given 15 grains of potassium bromide and 15 minims of digitalis every four hours, while the legs were well wrapped up in warm coverings. The next morning she felt more comfortable but still complained of pain in the thighs and had lost all power below the knees as well as all reflexes and sensation Three days from the onset she had an anginal attack, and her breathing became rattly while the chest was filled with moist sounds She was given morphine 1/4 grain atropine 1/100 grain and digitaline 1/50 grain Two hours later she felt much more comfortable By this time she had lost all power in her legs and thighs, the skin of which had assumed the blue mottling seen post mortem and no reflexes or sensation could be elicited apart from a small area on both thighs extending downwards for about two inches below Poupart's ligament, and running round the thigh rising somewhat posteriorly

The morning after the anginal attack following a restless night her colour had much improved though the heart was still fibrillating Her legs were in the same condition and micturition had by now become automatic. She remained in this state till the same evening (four days from the onset) when she had some severe convulsions in both arms Her bronchi became choked with mucus, and she died No post mortem examination could be obtained

The diagnosis appeared obvious at the first visit—embolism of the abdominal aorta—and, apart from palliative treatment, nothing could be done, as the patient would not consider removal to hospital

Two points are of interest (1) The reflexes and sensation, as also the muscular power, did not disappear for about fifteen hours from the onset (2) The small area where there was still warmth and sensation, the skin of which must have obtained blood from a collateral source

Hull. T STIRLING EDDIE, M B , B S Melb

TAENIA SAGINATA INFECTION

INFECTION by tapeworm does not appear to be very common in these days of strict control of slaughterhouses and meat inspection, so that the following case, which presented some unusual features, may be of interest

A Jewess, aged 56, had complained of severe pain in the epigastrium for over six weeks, with occasional vomiting after meals The usual gastric sedatives had no effect An examination of the stools for occult blood revealed the ova of *T saginata*, but no history of the passage of proglottides could be obtained A drachm and a half dose of the extract of male fern was given on an empty stomach the morning after the discovery of the ova Within ten minutes the patient collapsed and fell into coma, with twitching of the muscles of the face Ether was injected intravenously, and the patient vomited some of the drug shortly afterwards. She remained, however, in a stuporous condition for about two hours. The bowels then moved, and she gradually recovered consciousness A fully matured specimen of *T saginata* was passed later and the patient made an uninterrupted recovery No castor oil was taken by the patient for the expulsion of the worm, but I learnt later that she was in the habit of taking a dose of olive oil every night before retiring

I beg to thank Professor R T Leiper for his kindness in identifying the [illegible] tapeworm in this case.

Reports of Societies.

DELIRIUM TREMENS CAUSATION AND TREATMENT

AT a meeting of the Society for the Study of Inebriety on July 3rd, with Mr W McADAM ECCLES, president, in the chair, a discussion took place on the causation, prevention, and treatment of delirium tremens

Dr E F WILLS (resident medical superintendent, Rendlesham Hall, Suffolk), in an opening paper, first drew attention to certain points in causation The delirium was almost unknown in those who had only recently become immoderate drinkers, in other words, it was not in those who had periodic bouts at comparatively long intervals, but in the habitual soaker, that delirium tremens most commonly occurred It was possible that some intercurrent disease, such as an infection of the nature of influenza, might act as a determining factor in the immoderate drinker The vexed question of the onset being due to the sudden withdrawal of the usual excessive amount of alcohol taken demanded some further investigation The experience of those who had to deal with persons admitted into institutions for the treatment of inebriety was that the delirium was more likely to show itself when alcohol was suddenly discontinued to those who had been allowing themselves large quantities right up to admission This was confirmed by the fact that delirium was less likely to occur when there was a process of tapering the amount taken, even if the tapering under careful observation were fairly rapid In treatment Dr Wills laid it down that the alcohol should be tapered, as far as possible, in strict accord with the actual amount taken before the onset of delirium It was essential to obtain some sleep, probably hyoscine, or hyoscine combined with morphine, was the best method He urged that the functions of the liver in delirium tremens should be the subject of investigation Acidosis and acetonuria, both of hepatic origin, had been noticed in cases, ketones had also appeared in the urine, and this matter was really not understood Finally, it was pleasant to know that the number of cases of delirium tremens was on the decline, and a day might be expected when the disorder would have vanished altogether

Dr G B GRIFFITHS (a member of the Prison Commission) said that formerly, as a prison medical officer, he saw a good deal of delirium tremens Many cases came to prison hospital, perhaps a little stupid, and in the course of twenty-four hours developed the delirium His practice had always been not to taper the alcohol, but to cut it off straight away Years ago the number of cases seen in prisons was greater than now, but it was never very large He used to put the patients in a quiet, airy room, where they were under skilled observation, they were given eggs and milk, and so forth, with purges, and he never lost a case, nor did he remember a patient who suffered unduly The medical officers of London prisons, with whom he had been lately in touch, all declared that delirium tremens did not now exist One of them said that he had not seen a case for eight years Between 1920 and 1923, when statistics were gathered for the Board of Liquor Control, there were only four to six cases per annum in the prisons of the country Asked by the PRESIDENT whether he thought the cutting off of alcohol induced the onset of delirium tremens in some cases, Dr GRIFFITHS said that he did not think so, though he agreed that the shock of incarceration might have that effect, acting in the same way as the fracture of a limb had been known to do in such subject He had asked the prison medical officers if delirium tremens had diminished, and they suggested increased price of liquor, the diminution of alcoholic content also the general rise in intelligence and the multiplication of wholesome interests

Dr J D ROLLESTON said that when he first joined the staff of a fever hospital delirium tremens was certainly much more prevalent than at present This was very evident in the severe epidemic of small-pox in 1901–2, when a large number of the patients were men addicted to alcohol Of recent years, and particularly since the war, the occurrence of delirium tremens had been very slight indeed Among the 4,000 admissions yearly at the Western Hospital it was rare to see more than one case a year His practice had been to treat the cases without alcohol Alcohol had been cut off altogether, with beneficial results

Dr T STACEY WILSON said that he had seen very little delirium tremens in practice, though in his student days at the Edinburgh Royal Infirmary there was a delirium tremens ward In those days the cases were treated by cutting off alcohol straight away, and the treatment was by digitalis, chloral, and bromide—20 minims of tincture of digitalis, 20 grains of chloral, and 20 grains of bromide—given every two hours until the patient slept It was rare to have to give more than two or three doses before the patient slept and woke up recovered In cases of alcohol addiction he had found coramine—a synthetic camphor—very useful

Dr H T P YOUNG (Parkhurst) said that he had seen no case of delirium tremens for seven years, although he had had many thousands of prisoners passing through his hands During the last week, however, a case of the pre-delirium type had come under his observation, and had been treated on the lines he always adopted in these cases, so far with satisfactory results His plan was to cut off alcohol at once This man had a history of marked and prolonged alcoholic addiction, and on being admitted to the prison hospital became slightly tremulous, his urine was found to contain a large amount of albumin, and the skin was rather moist He was given an ordinary purgative, and put upon digitalis and diaphoretics, with a milk diet During a week no further symptoms pointing to delirium tremens had developed, and the condition was subsiding Digitalis was given for its diuretic effect

Dr W G PRIDMORE believed in tapering He could recall several cases of heavy drinkers coming to hospital—really good old soakers—and on their alcohol being stopped completely they developed symptoms, and on the resumption of alcohol they got right On the other hand, when dealing with drug addiction, he cut off the drug entirely

Dr C W J BRASHER recalled the case of a ship steward, who came to the out-patient department with severe scalding He refused to become an in-patient, but a few days later he was admitted with broncho-pneumonia, and almost immediately developed delirium tremens He was put on a certain quantity of alcohol, and continued for six weeks in an extremely hallucinated condition, and eventually had to be sent for a time to a mental hospital

Dr J H MORTON (medical officer, Holloway Prison) said that he had been brought up to believe that the way to treat delirium tremens was by tapering It was not until he entered the prison service, and saw cases of delirium tremens frequently, that he changed his views entirely In a hospital in Dublin of which he had had some experience, these people were put on a bottle of stout a day—stout being the liquor to which they had been used—and, perhaps as a consequence, they always had to have one male attendant Later, when he came upon these cases in prison, he cut alcohol off entirely The people were put on milk diet and on salines, and after a sleep of sixteen or twenty hours they got over their attack They were given practically no sedatives, though if the pulse was bad they would be given a hypodermic injection of strychnine, but they did extremely well without any alcohol The drug-takers needed more watching, but the same principle was followed in nearly all those cases also In the women's prison hospital for which he was responsible very few cases of delirium tremens were seen

Mr McADAM ECCLES, from the chair, in summing up the discussion, said that he was a little disappointed that no speaker had thrown more light on the question of causation It would be a slur upon the medical profession of this generation if delirium tremens disappeared as it might, without its real cause having been discovered As the result of the report of the present meeting perhaps some biochemist would be interested enough to take up this subject and carry out investigations If any such would get into touch with Dr Kelynack or himself, an endeavour would be made to place them in the way of getting material He was of opinion himself that something circulating in the blood, other than the alcohol, was the cause of delirium tremens

Reviews

RADIOGRAPHY OF PEPTIC ULCER

Peptic Ulcer,[1] by JACOB BUCKSTEIN, is the tenth volume of a series of monographic atlases published in the United States of America under the general heading Annals of Roentgenology. The editor of the series points out that the advances in radiology are so great as to make it almost impossible even for specialists in the subject to be familiar with all the appearances they are likely to be called on to interpret in the course of daily practice. The aim of the editor and publisher has been, therefore, to present a conspectus of standard radiograms prepared by leading authorities in special fields of x-ray diagnosis. The present volume on peptic ulcer ably fulfils these requirements. Dr. Buckstein is the specialist on gastro-intestinal roentgenology at *Cornell University and the Bellevue* Hospital, and his beautifully illustrated and fully documented book will be welcomed as a means of study and comparison by all who are interested in x-ray work on the alimentary tract.

The book opens with a short description of the anatomy and pathology of the stomach. This is followed by a concise account of the history and development of the application of radiology to the study of the normal and diseased stomach. Reiche in 1909 described the x-ray appearances of a chronic gastric ulcer verified at necropsy, and in the following year Haudek clearly indicated the diagnostic value of the presence of a niche, often containing opaque material after the rest of the stomach is empty, and of disturbances of motility of the stomach wall. Carman later described three types of spasm which may be associated with gastric ulcer: (1) an incisura due to spastic contraction of the circular muscle fibres in the plane of the ulcer; (2) a diffuse gastro-spasm, and (3) spasm of the pyloric segment, leading to retention of stomach contents. It is in ulcers in the neighbourhood of the pylorus, where the motor function is inhibited through direct involvement of the pyloric ring, either as the result of spasm or organic cicatricial contraction, that retention and gradual gastric enlargement characteristically occur, but retention for many hours may be present with ulcer of the pars media in cases where the pylorus is found to be normal. Further results of cicatrization of gastric ulcers may lead to hour-glass contraction of the stomach which is invariably secondary to organic disease (Moynihan), or an indrawing or shortening of the lesser curvature on each side of the ulcer, or to coronal radiation of the rugae of the mucous membrane round the ulcer. Of these appearances, however, the presence of a niche is the only absolute diagnostic criterion. Buckstein recommends the double meal favoured by Continental radiologists (cf. Haudek, *British Medical Journal*, 1929, ii, p. 173). Two ounces of barium sulphate are given with some cereal breakfast food six hours before the examination in order to observe the motility. After determining the state of the preliminary meal a further four ounces of barium sulphate suspended in a glass of water are given and the examination of the oesophagus, stomach, and duodenum is continued. Screening results are supplemented by films, which form both a permanent record and a control of the observations made on the screen. Since the important thing is to demonstrate a niche if present, it is essential to observe the stomach from all angles in order to secure profile. The normal stomach shows a fair variation in size and shape and more particularly in position, but shows no deformity of contour, no break in continuity or interruption in the course of the peristaltic waves of the lesser and greater curvatures.

The author emphasizes the deceptive appearances that may be given by a single film, and refers to the differential diagnosis of deformation of the greater curvature by gas in the splenic flexure, and of the superimposed duodeno-jejunal flexure or of a diverticulum. Two of the pitfalls illustrated, however, are inherent in the double-meal method—namely, superimposed barium in haustrations of the colon from rapid passage of the first meal and superimposed calculus in the left kidney. British radiologists usually prefer to screen the patient empty for opacities in the abdomen, and then to give a single meal, watching the emptying of the stomach at intervals to obtain a serial picture. Malignant disease of the stomach favours the greater curvature, and is characterized by a filling defect, but early indication of the rigidity of infiltrated stomach wall is given by absence of peristalsis in an area observed when serial films are superimposed. In healing gastric ulcer the disappearance of the niche is studied, it is only much later that normal peristalsis in the area involved is resumed. Duodenal ulcer is stated to be six times as frequent as gastric ulcer. In duodenal ulcer a niche is found (it occurred in 19 per cent. of the Bellevue Hospital series), but persistent characteristic deformity of the duodenal bulb is the essential diagnostic feature. Tenderness of the duodenal bulb when it is visualized on the screen is an important aid. With duodenal ulcer there is often exaggerated gastric peristalsis and in some cases retention of the preliminary meal obscures the duodenal lesion. Complications of gastro-enterostomy, jejunal ulcer and gastro-colic fistula are fully illustrated.

Dr. Buckstein's book is a pleasure to handle, and may be recommended for study and reference to clinicians and radiologists alike.

FRENCH VIEWS ON CANCER

THE second volume of Part V of Roger, Widal, and Teissier's great treatise on medicine[2] is concerned solely with the subject of malignant disease. It has been written by Professor ROUSSY in collaboration with Professor LEROUX and Dr. MAURICE WOLF, and may be taken to represent the orthodox conception of cancer as held in France at the present time.

Recent researches have vastly extended the scope of the subject, which has now passed beyond the limits of medicine and definitely taken its place as a branch of general biology. Accepting this extended view the authors have found it necessary to recast the previous edition completely, and in addition to providing the usual information demanded by those engaged in the practice of medicine and surgery, have entered very fully into such questions as the pathological physiology of the cancer cell and cancer tissue, the experimental production of cancer, the disease as met with in the lower animals, tumours of plants, tissue culture, the action of x rays, radium, and chemical substances on malignant growths, the geographical distribution of cancer, and the various organizations which have been established in different countries to combat the disease. These subjects, which, as the authors state, would require several volumes for their adequate treatment, are dealt with as fully as the limited space of eight hundred pages permits.

With regard to the etiology of cancer, the authors distinguish several theories—namely, the theory of simple bacterial infection, the theory of a virus associated with a chemical factor, the theory of cell disease developed mainly by Carrel by the method of tissue culture, the glycolytic theory of Warburg, and the mitotic theory of Boveri and Masson. The essential cause of cancer remains unknown, but the authors consider that recent work on the subject points to some physico-chemical action rather than to bacterial infection. It is agreeable to find that the authors have in the main adhered to the orthodox classification which has the advantage of being universally understood. The inconvenience of a multiplicity of new names is keenly felt at the present time, and the prevailing custom of conferring unfamiliar names on familiar tumours is a mere darkening of counsel with words which leads to confusion. The accounts of the several types of tumour follow in the main the classical descriptions, in one or two particulars however the accounts differ from those adopted in this country. For example, English pathologists will experience some difficulty in accepting the view that mixed

[1] *Annals of Roentgenology*. Vol. x. *Peptic Ulcer*. By JACOB BUCKSTEIN, M.D. New York: P. B. Hoeber, Inc. 1930. (8 × 10½ in. xxiii + 337 pp. 237 figures. 12 dollars.)

[2] *Nouveau Traité de Médecine*. Par C. H. ROGER, FERNAND WIDAL, P. J. TEISSIER. Fascicule V (Tome IV). *Le Cancer*. Par GUSTAV ROUSSY avec la collaboration de MM. LEROUX et MAURICE WOLF. Deuxième édition entièrement refondue. Paris: Masson et Cie. 1929. (Sur roy. 8vo, pp. 843, 238 figures, 19 pl[illegible]. 100 fr.)

tumours of the parotid are cancers, though they will admit that a malignant transformation is occasionally met with The tumour has always presented a difficulty, especially the question of its endothelial or epithelial nature, and indeed the whole subject of endothelioma is still obscure The authors have avoided some of the difficulties by confining the term to tumours of the serous membranes, distributing the remaining growths which usually pass under the name among the sarcomas and epitheliomas Another tumour, benign in character, which has given rise to differences of opinion, is that affecting the extremities of the long bones and known in this country as myeloma The authors apparently do not regard it as a tumour, they recognize a malignant growth in that situation—a myelosarcoma—but the very similar bulky enlargements which are still more common and lack the characters of malignancy they apparently regard as inflammatory products The subject, however, is dismissed in a few lines An excellent account is given of tumours of the meninges, and the theories of Cushing and Oberling are discussed with discrimination Paget's disease of the nipple is classified under the keratoses or dyskeratoses, the change in the epithelium being considered to start in the cutaneous surface, in the ducts, or in the depth of the gland, and terminating, as may occur in keratoses elsewhere, in the formation of cancer It may be remarked in passing that the illustrations to the section dealing with the pathological anatomy possess the artistic qualities which are generally a prominent feature in French works

The authors conclude their account of the experimental work done on cancer with a summary of the results obtained This line of inquiry has proved a relation between certain parasites and cancer, as in Fibiger's experiments with spiroptera, an individual predisposition has been shown to exist in some cases, both individual and local, in the form of precancerous conditions, a prolonged period of latency has been shown to characterize the development of the growth, important information has been obtained with regard to the local reaction to the presence of cancer tissue, and, as regards grafted cancer, a natural immunity has been shown to exist, together with the possibility of inducing an artificial immunity Experiments relating to immunity to spontaneous growths are at present scanty An extensive account is given of the treatment of cancer by means of x rays and radium, and brief general indications of treatment are summarized as follows radium treatment is the method of choice, in the opinion of the authors, in cancer of the skin, buccal cavity, and cervix uteri, x rays are preferable in cancer of the larynx, oesophagus, and pharynx, surgical excision is the method of choice in cancer of the breast, rectum, body of uterus, and certain sarcomas, and in cancer of the internal organs

PHARMACODYNAMY

ELEMENTS of General Pharmacodynamy,[3] by Professor E ZUNZ of Brussels, is a very interesting book, in which the author has attempted to describe the general laws regulating the action of drugs on organisms The need for a volume dealing with these problems has long been felt, but no one hitherto has had the courage to try and cover this very difficult ground The author deals with such problems as the absorption of drugs, the alterations they undergo in the body, and the laws governing the excretion and cumulation of drugs, and idiosyncrasy and tolerance to drugs

Pharmacology is one of the youngest of the medical sciences, and of necessity started as a descriptive science The first stage was analysis of the actions produced on the functions of animals by administration of the drugs that were in common use in medicine The development of chemotherapy led to extensive studies of the relation between the chemical structure and the pharmacological action of numerous series of drugs, while the introduction of biological standardization directed attention to the laws governing the relation between dosage and action The literature dealing with these problems is exceptionally difficult to master for it is of great bulk, and is scattered through a wide variety of journals Moreover, it presents a vast mass of detail linked by very few established general principles Consequently the production of the volume under review must have been a very laborious task

The author points out in his preface that most of the laws of general pharmacology cannot be established until chemistry, physics, physical chemistry, and general physiology have reached a fuller stage of development His volume is therefore of a provisional nature, and probably many of the tentative conclusions will require modification in the future Professor Zunz is, however, to be congratulated on his courage in having attempted to tackle this difficult problem He has brought together into a single volume a great mass of information, and although the evidence available is at present inadequate for the formulation of many general laws, yet this collection of data greatly facilitates the study of the problems involved, and should stimulate future research in this important but neglected field

IMMUNOLOGY OF PARASITIC INFECTIONS

THE study of immunology has for so long been associated with bacteriology that there is a tendency to consider it as a part of that science rather than as a part of pathology The appearance of Professor TALIAFERRO'S *Immunology of Parasitic Infections*[4] is accordingly the more welcome in drawing attention to the part played by animal parasites in the causation of reactions in the host This volume is the first comprehensive survey of the immunological work that has been done on the infections with animal parasites It is excellently planned, clearly and lucidly written, and is a contribution of the greatest importance to our knowledge of the processes of disease

The book is divided into nine chapters, each a complete review of its own aspect of the subject Chapter 1 deals with concepts of parasitism, infection, and immunity reactions, Chapter 2 with the various serological reactions used in diagnosis—for example, complement fixation, formation of precipitins, and agglutination—with special reference to such conditions as leishmaniasis, trypanosomiasis, malaria, schistosomiasis, hydatid disease, and trichinosis, Chapters 3 and 4 with lysins and reproduction-inhibiting antibodies in relation to the types of infections in trypanosomiasis and malaria, and to the protective and curative effect of immune serums, Chapter 5 with hypersensitiveness and the cutaneous diagnosis tests, Chapter 6 with the production of symptoms by parasites, and with toxins, endotoxins, and hypersensitiveness, Chapters 7 and 8 with the cellular basis of immunity and the nature and production of immunity, and the last chapter with serological and immunological reactions used in the classification of parasites Each chapter is provided with a useful summary, but the references are collected together at the end of the book, there being over a thousand titles in this part The volume concludes with a full index

Professor Taliaferro's book would be a useful addition to the library of the parasitologist and the pathologist if only because it is the first on its subject But the author has treated the immunology of parasitic infections so exhaustively, lucidly, and systematically that it is sure of a permanent place in all medical libraries

TREATMENT OF CHILDREN'S DISEASES

DR S A LEVINSOHN'S translation of the sixth German edition of Professor F LUST'S authoritative textbook on *The Treatment of Children's Diseases*[5] is very welcome, for since the first appearance of the work in German twelve years ago it has been increasingly recognized as a valuable guide for all paediatricians Dr Levinsohn has done more than translate, he has revised and annotated the book, and when once the early irritation caused by interpolated paragraphs in small print is got over the reader will find the translator's notes sensible and helpful

[3] *Elements de Pharmacodynamie Générale* Par Edgard Zunz Paris: Masson et Cie 1930 (6½ × 10 pp 488 78 figures 75 [illegible])

[4] *The Immunology of Parasitic Infections* By William H Taliaferro Ph D The Century Biological Series New York The Century Company, London J Bale, Sons and Danielsson, Ltd 1929 (6 × 9, pp xv + 414 28 figures 20s net)

[5] *The Treatment of Children's Diseases* By Professor Dr F Lust Authorized translation of the sixth German edition, with additions by Sandor A Levinsohn, M D London J B Lippincott Company 1930 (Med 8vo pp xii + 513 30s net)

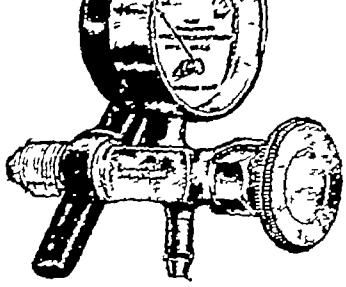
Part I of the book deals with the diseases of childhood, each introduced by a short diagnostic summary followed by details of treatment, while Part II contains an admirable account of drugs and formulae useful in the treatment of children, including directions for preparing most of the foods used for infants

A small monograph by Drs F LESNÉ and R CLÉMENT on Diets for Infants[6] might well be read in conjunction with Professor Lust's textbook, for the well-known Gallic enthusiasm for the good things of the table has obviously served as a stimulus for the production of many interesting menus for the infant in health and disease Sections dealing with broths, with vegetables, cheese, meat, fish, eggs, etc, contain many practical points for doctors, mothers, and cooks Incidentally these French authors know how to spell Sir Thomas Barlow's name, and thus have the advantage of Dr Levinsohn

NOTES ON BOOKS

DRS. W *Russell Brain and* E B STRAUSS faced with the necessity of revising *Recent Advances in Neurology*[7] about a year after the publication of the first edition which was reviewed in our issue of April 6th, 1929 have had to rewrite a number of sections completely to make substantial additions to others, and to add a considerable amount of new material Between the publication of one edition of a formal textbook and the next it is usual to allow a decent interval, but only by piling edition swiftly upon edition can the authors of a work purporting to embody recent advances in a growing subject eliminate material that has gone stale and keep pace with the mass of new observations and discoveries a representative selection of which must be included if the book is to live up to its name New material in the work under review includes sections on the angiomatous malformations and blood vessel tumours of the brain measles encephalitis, and the treatment of subacute combined degeneration The section on acute disseminated encephalomyelitis has been rewritten, and the sections dealing with post vaccinal encephalitis, serum treatment of anterior poliomyelitis, and the malarial treatment of general paralysis have been revised and enlarged All the subjects treated in *Recent Advances in Neurology* have a clinical bearing, and their presentation is admirable

DR HARRY STURGEON CROSSEN'S well known textbook on *Diseases of Women*[8] has again been thoroughly revised this time with the help of Dr ROBERT JAMES CROSSEN whose name appears as co author on the title page Dr Ehrenfest has completely rewritten the chapter on internal secretions in relation to gynaecology, and attempted to present a guide to rational endocrine therapy in this field, Dr R J Crossen has revised the chapters dealing with bladder and ureteral affections and Dr H S Brookes jun has contributed a new chapter on the lower intestinal tract Like its predecessors the present edition is attractively printed illustrated and produced, and the authors may be congratulated on their skill in increasing the scope of the work while diminishing its bulk by about 150 pages.



The third edition of Orthopaedy in Childhood,[9] by those distinguished orthopaedic surgeons Professor HANS SPITZY of Vienna and Professor FRITZ LANGE of Munich does credit to its authors and publishers. The book is intended for paediatrists and general practitioners, but specialists will find a comprehensive bibliography at the end of each section In his preface Professor Spitzy pleads for a separation of the orthopaedic disorders of childhood from the surgical diseases, not merely because of the great development of surgical technique in the last decade and the simultaneous advance of the orthopaedic specialty but because in orthopaedics operative treatment, which takes the first place in general surgery is only one of many forms of treatment, in many conditions mechanical and bloodless methods being more important. The introductory chapter deals with orthopaedics and physical training taking into account the development of the erect position, gymnastics and sport The body of the work is then divided into sections under the following headings congenital deformities disturbances of post foetal development tuberculosis of bones and joints paralytic injuries plaster-of-Paris technique and physical therapy Spitzy and Lange's textbook is an excellent guide to the subject of orthopaedics and can be recommended to all who read German It is well illustrated

In his Notes on the History of Surgery in Venezuela,[10] which form d the thesis for his admission to the Venezuelan Academy of Medicine, Dr P D RODRIQUEZ PIVERO gives an interesting description of the progress of surgery in Venezuela from pre-Columbian times down to the present day Special attention is given to the work of the three outstanding surgical personalities of Venezuela of the nineteenth century—namely, Jose Vargas, who founded the chairs of anatomy, surgery and chemistry at the University of Caracas Guillermo Michelena a brilliant operator teacher and writer, and Acosta Ortiz, described as the prototype of the modern surgeon

PREPARATIONS AND APPLIANCES

FINE ADJUSTMENT OXYGEN VALVE

DR. K. B PRYSON (anaesthetist to the Manchester Royal Infirmary) writes I have made some improvements in the fine adjustment oxygen valve manufactured by the Manchester Machine and Instrument Manufacturing Co Ltd (2 Booth Street Manchester) particularly with regard to the pressure gauge which indicates the quantity of gas left in the cylinder

The gauge shown in the accompanying illustration has now an improved movement which obviates back lash of the pointer and is also cheaper in production It is also built as an integral part of the valve which does away with the comparatively expensive union between gauge and valve—a union, too which was rather liable to develop leaks if accidentally knocked or tampered with.

A CARBOHYDRATE FOR DIABETICS

Sionon (Bayer Products Ltd.) is a preparation of sorbit which is a glucohexite introduced by Thannhauser for the purpose of supplying to the diabetic a carbohydrate which can be metabolized more easily than glucose Sionon has a sweet taste and has a calorific value practically equivalent to glucose Like other carbohydrates it is slightly laxative, but quantities up to 3 oz a day rarely produce diarrhoea. It has been reported on favourably by various well-known German clinicians, and appears to deserve trial in the dietetic treatment of diabetes.

LACTOSE IN MINERAL OIL

Colactin (E. H. Spicer and Co Ltd Watford) is a suspension of lactose (40 per cent.) in pure mineral oil (56 per cent.) The preparation is intended for the treatment of alimentary toxaemia The mineral oil acts as a laxative and checks the digestion and absorption of lactose in the small intestine Hence the lactose reaches the colon, and there encourages the growth of the harmless *B acidophilus* thus tending to inhibit the reproduction of putrefactive organisms The makers recommend the combined administration of colactin with *B acidophilus* emulsion.

CALCIUM THERAPY

Calcumint is a palatable preparation of calcium salts The distributors in this country (Messrs Coates and Cooper 61 Great Tower Street E.C.3) inform us that it contains the following salts calcium lactate calcium carbonate, calcium formate calcium glycero-phosphate and calcium phosphate. Calcium salts have been recommended for a very wide variety of diseases and it is claimed that this is a palatable preparation easily absorbed when given by the mouth

OXFORD OPHTHALMOLOGICAL CONGRESS

THE twentieth annual meeting of the Oxford Ophthalmological Congress, founded by the late Robert Doyne in 1910, was held at Oxford on July 10th, 11th, and 12th, the members meeting informally at dinner on July 9th in the Hall of Keble College, which again offered hospitality, as in former years Each member was accommodated in the College, and the consequent facility for social intercourse was much appreciated The proceedings of the Congress were conducted in the Department of Human Anatomy of the University, kindly made available by Professor Arthur Thomson, to whom the Congress is under a deep debt of gratitude In addition to the scientific museums a commercial exhibition was arranged, numerous well-known firms of ophthalmic instrument makers displaying the latest forms of apparatus and instruments Included in the large number of foreign members and others resident abroad who attended the Congress this year were Professor Gonin of Lausanne, Professor Schuller of Vienna, Dr Harry Friedenwald of Baltimore, Professor Curran of Kansas City, Drs Bernard Samuels and Tyson of New York, Dr Derrick T Vail, jun, of Cincinnati, Dr van Heuven of Utrecht, and Dr André Patry of Geneva

Toxic Amblyopia

The proceedings opened on Thursday, July 10th, with a short address of welcome by the Master of the Congress, Mr A BERNARD CRIDLAND Immediately afterwards Dr TRAQUAIR introduced, from the ophthalmological standpoint, a symposium on toxic amblyopia, including retrobulbar neuritis He was followed by Sir Farquhar Buzzard, who discussed the matter from the point of view of the physician, and Professor J A Gunn amplified the subject from the pharmacological aspect Dr TRAQUAIR said that to the clinical ophthalmologist retrobulbar neuritis presented itself as a visual defect in the form of a central or paracentral scotoma, not explained by the visible ophthalmoscopic changes in the macular region He commented on the rapid onset and gradual recovery, which was often complete, the defect varying from slight visual loss to complete blindness The characters of the scotoma were the predominant involvement of the area of the crossed fibres, and the importance of the detection of quadratic or hemianopic features was emphasized The appearance of the optic disc might vary from the normal to that of a choked disc, or there might be pallor The clinical picture varied considerably, irrespective of the different causes, but certain forms showed features which were to some extent distinctive In retrobulbar neuritis with myelitis the visual defect was bilateral, and might exhibit quadratic features indicating a chiasmal site There was also gross swelling of the optic discs The scotoma in Leber's disease was bilateral, with a less pronounced tendency to recovery In acute retrobulbar neuritis the defect was unilateral, and the tendency to recovery was very pronounced The pathological basis of the disease was the formation of plaques in the optic nerve, which had a special inclination to affect the papillo-macular fibres As regards its etiology, retrobulbar neuritis might be regarded as a manifestation of disease elsewhere rather than as a primary disease of the optic nerve, the cause must therefore be sought elsewhere in the body Differences of opinion existed as to the relative importance of certain causes, such as multiple sclerosis, paranasal sinusitis, and dental and tonsillar infections The true lesion might not be manifest for a long time The diagnosis of the cause was based on the study of the eye symptoms and on general physical examination, together with that of the visual fields and the detection of quadratic or hemianopic features in the scotoma Radiograms were very useful, the tendency to neglect the eye symptoms in favour of a search for a septic focus was to be deprecated The prognosis was good in the acute form, and usually favourable in others Complete blindness, even of one eye was a rare result The expression "toxic amblyopia" referred to partial blindness due to toxins in the circulation, but no distinct boundary existed between toxic amblyopia and retrobulbar neuritis, the pathological lesion had been found by Roenne to be the same in both In tobacco amblyopia, as an example, blindness was never produced, and the influence of the physical condition of the patient should always be borne in mind In quinine amblyopia the visual defect was due to direct toxic action on the nerve elements rather than to retinal ischaemia

Sir FARQUHAR BUZZARD, approaching the question from the point of view of the physician, quoted a passage in a paper written by his father in the last century, emphasizing the importance of these ocular symptoms in certain nervous diseases He discussed the clinical aspects of these conditions from a neurological and general medical viewpoint Professor GUNN dwelt on the pharmacological considerations in these diseases, and suggested much closer co-operation between the pharmacologist and the ophthalmic surgeon, the laboratory worker and the clinician should work hand in hand The subject of quinine amblyopia was also raised The discussion was continued by Dr LEIGHTON DAVIES, who referred especially to the contraction of the visual fields in certain conditions Other speakers were Mr GRAY CLEGG, Mr ADAMS, Drs ROSA FORD and ANDRÉ PATRY, Mr MONTAGU HARSTON, Professor SCHULLER, Messrs JOSEPH, BROWNING, HARRISON BUTLER, GREENE, CYRIL WALKER, YOUNG, GIRI, GALLOWAY, HAYCRAFT, and Drs TYSON, PRIMROSE, and THAKORE Dr BERNARD SAMUELS subsequently read a paper on opacities in the vitreous, he showed some beautiful drawings, and fully described their appearances and general character

The Nature of Light

In the afternoon Sir OLIVER LODGE, F R S, delivered a most interesting and lucid lecture entitled "Modern theories on the nature of light" to a large audience He prefaced his remarks by saying that he did not know how much his hearers knew, and expressed the hope that his address would not be too elementary—a humorous quip which appealed to those present He first gave a short sketch of the corpuscular and wave theories, and the reasons why the wave theory must be true He then proceeded to develop the argument that the corpuscular theory must also be true Modern attempts at the unification of these two theories were then fully described, and a probable theory of the nature of vision was defined The interaction of matter and radiation was fully dealt with, and its consequences were described At the conclusion a vote of thanks, proposed by Mr LESLIE PATON, president of the Ophthalmological Society of the United Kingdom, and seconded by Mr CYRIL WALKER, was carried with acclamation

The Doyne Memorial Lecture

The Doyne Memorial Lecture this year was delivered by Dr H FRIEDENWALD of Baltimore, who took for his subject the pathological changes in the retinal blood vessels in arterio-sclerosis and hypertension The lecturer gave a most minute and careful description of the alterations in the eyes in these conditions, illustrating them clearly by means of a number of lantern slides This important address does not lend itself to abstracting, and will well repay being studied in the original Mr P ADAMS, the deputy master, and Dr TRAQUAIR, who proposed and seconded respectively the vote of thanks to the lecturer, expressed the gratitude of the large audience and its appreciation of a contribution of remarkable merit to the eminent series of Doyne Lectures

Miscellaneous Papers

On Friday morning an address was given by Professor SCHÜLLER of Vienna, on recent developments in radiology associated with ophthalmology He first described in much detail the normal variations of the sphenoid, and then passed on to an account of the inflammatory conditions and neoplasms of its sinus Infiltrating processes were next discussed, and the destruction of the bone by intracranial tumours Sinuscele of the sphenoid was illustrated, and the deformities found in neuro-fibromatosis

were described Professor Schüller who spoke for an hour in faultless English without notes, was listened to with rapt attention, and at its conclusion was accorded an ovation by his large audience The paper was discussed by Dr BOWIE Mr EDMUND JONES, Dr TRAQUAIR, and Mr FOSTER MOORE

On Friday afternoon an address was given by Professor JULES GONIN of Lausanne on detachment of the retina and its treatment He related how he had recognized the truth of Leber's theory that acute detachment was due to vitreous fluid passing through a retinal tear into the subretinal space and how he had been led by further research to complete that theory and to extend it to all so-called spontaneous or myopic detachments In all these forms, the tear being the determining cause of the detachment and hindering it from healing the most certain way to a definite cure was to close the hole by scarring with a thermo-cautery when possible He stated that in all recent cases when the hole had been closed, cure was immediate and permanent relapse of the detachment showed that the tear had not been sealed If the retinal tears were large or multiple treatment took long and might be impossible The author illustrated by means of drawings his procedure for localizing the retinal tear and the method of operating *also the ophthalmoscopic appearances of the detached retina* before and after the thermo-puncture The following members joined in the discussion Messrs ORMOND CUTLER JULER HAY RIDLEY Sir WILLIAM LISTER Messrs HAY RAFT, GRAY CLEGG, CIRI HARRISON BUTLER, and LINDSAY REA

On Saturday morning Mr HARRISON BUTLER read a paper on keratoconus posterior or a hitherto undescribed condition *discovered by the aid of the slit-lamp* This was discussed by Dr MARION CULPHIST, Miss MANN, Dr TRAQUAIR, and Mr GRAY CLEGG

Dr TRAQUAIR read notes on new instrument and technique in cataract extraction his report was discussed by Mr GRAY CLEGG, Dr DERRICK VAIL jun and Messrs CRITENT, CHAVASSE STEWART, Professor CURRAN and Dr GIRI

Dr DE COURCY contributed a paper on interstitial keratitis in workmen's compensation cases This in creasing medico-legal pronouncement attracted much attention, and was discussed by Messrs HARRISON BUTLER, BICKERTON, YORKE JACQUES PRITCHARD, KENDALL, HAY, ALABASTER, and the MASTER

Dr VAN HEUVEN of Utrecht gave a short account of recurrent chronic uveitis which was illustrated by many excellent lantern slides and was discussed by Dr CHAVASSE.

Demonstrations

During the afternoon of Thursday July 10th, various demonstrations were given in the Scientific Museum Mr *BURDON-COOPER demonstrated the orthogon test* Mr ARTHUR GREENE showed a specimen of ciliary growth causing glaucoma Dr TRAQUAIR exhibited a model of a field of vision, and Mr ALABASTER a stereoscope useful in fusion training Mr TUDOR THOMAS gave a demonstration of live rabbits with transparent corneal grafts Mr ERNEST MADDOX showed a hand attachment for the ring test, together with a stereoscope

Social Events

In the afternoon of July 10th tea was provided for members and their friends at Worcester College where they were received by the Provost, Mrs LYS, and Mrs Bernard Cridland

In the evening the annual dinner of the Congress was held in the Hall of Keble College, under the presidency of the Master Among the guests present were Lady Airedale, Sir Farquhar Buzzard, Professor and Mrs Schüller, Professor Conin, and Dr Evans The dinner was the largest ever held in connexion with the Congress 142 members and guests being present The Master in the course of his speech stated that it was the twenty first year of their history, although only the twenty th meeting In 1926 there was no Congress owing to the English Speaking Ophthalmological Congress which was held in London that year He read a letter from the American Ambassador regretting that absence abroad made it impossible for him to be present A letter from the president of the Röntgenological Society of Vienna was also read, congratulating the Congress on being the first one of that specialty to place radiographic diagnosis in the forefront of their programme Mr CYRIL WALKER proposed the toast of "The Guests," and Professor SCHULLER replied. At the conclusion of the speeches Mr GRAY CLEGG presented Mr Cridland on behalf of the members of the Congress with a gold watch and a set of table silver as a memento of his woman services for fourteen years as secretary of the Congress Mr Greene presented the Master and Council with a badge of office to be worn on official occasions by the Master in the future He reported that subscriptions had come in from all over the world for the testimonial which showed how much Mr Cridland's strenuous efforts *during so many years had been appreciated* Mr Cridland, who was obviously much affected by this recognition of his work, replied in a charming little speech of thanks

The proceedings closed on Saturday, July 12th at midday, and it was the unanimous opinion that it was the most successful meeting in the history of the Congress Indeed, the number of members present—namely, 149—greatly exceeded any previous record and severely taxed the capacity of the University Anatomy Theatre and the executive staff of the Congress

BRITISH EMPIRE CANCER CAMPAIGN

ANNUAL GENERAL MEETING

THE DUKE OF YORK, who presided over the annual general meeting of the British Empire Cancer Campaign at the House of Lords on July 14th, said that medical science had achieved much in recent times towards attaining supreme victory over cancer, but very much more remained to be done The Campaign had always encouraged every form of cancer research, both at home and abroad Its recent work included the formation of provincial councils in Great Britain, thus establishing new research centres The International Conference of 1928 was still an outstanding landmark in the medical records of all nations, its immediate result the launching of the National Radium Fund was now an accomplished fact, and treatment centres had been brought into existence but the usefulness of these centres might be extended still further if some form of organization was set up to help poor patients to attend for treatment, especially those who lived at long distances His Royal Highness congratulated the Grand Council on its decision to issue, early in the autumn, a book bearing the title, *The Truth about Cancer* He also commended the annual report (summarized below), which contained the record of nearly every research centre in the country and was a most interesting document

THE MARQUESS OF READING moved a vote of thanks to the Duke of York for his continued interest in the Campaign, and this was heartily carried On the motion of Mr STANFORD CADE, the members of the *Grand Council* were re-elected

Sir CHARLES GORDON-WATSON, *proposing the adoption* of the annual report, said that the policy adopted by the Campaign of pooling all resources both financial and scientific, was steadily being justified Cancer research was no longer the independent and unco-ordinated function of a number of different institutions A study of the annual reports must convince the most sceptical that there was no avenue which was not being explored Given financial facilities to continue cancer research under the direction of the Campaign and of sister Campaigns in other countries it seemed hardly conceivable that the problem could wade solution for much longer Thanks to the creation of the National Radium Fund research centres were now fairly well supplied with radium. In the treatment of cancer in one or two regions of the body *radium had almost supplanted* surgery and might supplant it, but in the present state of knowledge more harm than good was likely to arise if radium were exploited by those

inexperienced in its use. *With regard to x rays*, physicists recently had been able to shorten the wave-length so as to bring this agent in close competition with radium. It was possible now to construct *x*-ray tubes to stand up to 500,000 volts, and thus a weapon of equal potency to radium, but of far greater flexibility, was being forged. In the research for the cause of cancer the Campaign had spent large sums on investigation into serum reactions. He himself believed in the ultimate possibility of the immunization of the body against cancer.

SIR RICHARD GARTON *seconded the adoption of the* report, and pointed out the need for increased financial support if the requests expected to be received for the subsidy of approved research work were not to be refused.

With the adoption of the annual report and the re-appointment of the auditors, the proceedings concluded, but the quarterly meeting of the Grand Council followed, under the chairmanship of Lord READING, His Royal Highness remaining. On the motion of SIR JOHN BLAND-SUTTON, seconded by Sir THOMAS HORDER, Lord Reading was re-elected chairman of the council. *Several grants* were approved, including one of £680 for the maintenance of the radon centre at Middlesex Hospital for one year, and one of £300 to Westminster Hospital to carry out the physical part of a scheme of cancer research which had been submitted.

Mr LOCKHART-MUMMERY said that it was hoped that as a result of the forthcoming visit of the two vice-presidents, Lord Dawson of Penn and Sir John Bland-Sutton, to Canada in connexion with the Annual Meeting of the British Medical Association, some steps might be taken towards the formation of a federal council. In the meantime he proposed that assent be given to an application by the Cancer Service of the Government of Saskatchewan to become a branch of the Campaign, this was approved. He also moved that, in order to prevent overlapping of research work, provincial councils of the Campaign should be asked to furnish details to the Grand Council of all researches they proposed to subsidize before such subsidies were finally decided. This was adopted, as was a further motion by Mr SAMPSON HANDLEY for the affiliation to the Campaign of the Anti-Cancer Campaign of the University of Adelaide.

THE SEVENTH ANNUAL REPORT

In presenting its seventh annual report the Grand Council indicates broadly the advances made since the Campaign began. At that time research and treatment were conducted by individuals and small bands of workers with very little co-ordination of effort. There is now a headquarters staff, an intelligence department, and a system of co-ordination by which waste of effort is reduced and workers can learn what others are doing, the fruit of research in one area being made available at once in others. An immense mass of material has become available as a result of the fact that cancer of the skin and breast can now be produced experimentally in mice with almost absolute certainty. Causes of cancer formerly scarcely suspected have been discovered in this way, and the *conditions which govern the growth of* tumours are being diligently worked out. Treatment of various kinds is being tried, and the ground has been cleared in a most valuable way. The British Empire Cancer Campaign, which has been in close touch with the National Radium Commission since its formation, has co-operated with it in devising forms of record to be used in all cases treated by radium—a matter of very great importance. During the year under review a prize consisting of a medal and £500 has been offered for the best essay on the early diagnosis of cancer. The Campaign is about to issue a popular account of cancer for laymen, explaining its nature and indicating what has been discovered about its origin, course, and treatment. More than £28 000 has been expended during the year, and an appeal is made for still more generous subscriptions. The bulk of the report consists of statements by institutions and individuals in receipt of grants, and certain general conclusions are summarized.

Treatment by Radium

Several of these statements deal with radium treatment and with research work on the action of gamma rays upon normal and malignant cells. There is a general tendency now to employ smaller doses with increased screening for longer periods, since better results are being obtained as regards the disappearance of growths and increased interference *with normal tissues*. A popular method is interstitial needling of the base and edges of the growth, combined with the use of radium in surface applicators held in position by wax shields. The best results have been obtained in cancer of the cervix, mouth, tongue, and pharynx, and therefore the benefit of this treatment should soon become evident in a substantial reduction of the annual cancer mortality figures when early cases are dealt with in still larger numbers. The statements relating to treatment of cancer of the rectum in this way are rather more favourable than those of last year. Emphasis is laid on the importance of careful technique, in view of the variable sensitivity of some growths to radium and the varying resistance of different kinds of *neoplasmata*. In lesions of the skin, cervix, and the floor of the mouth the sequels of treatment by radium are actually better than those of surgical operation. Reference is made to the bomb consisting of 4 grams of radium element lent by the Radium Commission to the Westminster Hospital, the method of employment of which is referred to again in this issue at page 98.

X-Ray Therapy

Research continues on the use of hard x rays in the treatment of cancer, an important and authoritative report has now been issued, based on work done during the past five years. As in the case of radium some tumours have proved to be more resistant than others, and the findings of investigators of this phenomenon are being studied with great care in view of the important relation of this resistance to treatment.

Serological and Cytological Researches

The possibilities of serum immunization against cancer are being explored in rats and mice with special reference to tumours arising spontaneously, the more resistant type of malignancy. A strain of mice has been obtained from America in which such tumours are very common, and this particular line of research has thus been rendered easier. Some evidence is available that the livers of rats affected by cancer acquire an enhanced immunizing power. Work is continuing on the artificial development of "tissue immunity" to cells of neutral salts, such as strontium chloride and calcium chloride. Mercury has been found to be the most potent heavy metal in stimulating cell proliferation, with silver next, and copper in the third place. It has been deduced that electro-kinetic processes are involved in the cellular reaction, and that possibly a precipitation of the colloids of the cell membrane is an essential phase in the sequence of changes which culminate in cell division. It is now recognized that there is an excessive formation of lactic acid in the growth of cancer cells, as compared with that of normal cells, and also a high ability in the former to produce this acid from dextrose in the presence or absence of oxygen. Pancreatic extracts appear to stop this production of lactic acid, and it is possible that a new practical method of attacking cancer may be evolved. Suggestions have been made that cancer is caused by a poison naturally soluble in fat, and present in the body for a long period before it begins to act, attention is being directed to the possibility of isolating this toxin.

Carcinogenic Agents

A step forward seems to have been taken in the research for the cancer-producing element by the discovery that substances readily active in this way have a characteristic fluorescence spectrum. Mention is made of the important anti-carcinogenic properties of mustard gas.

British Medical Journal.

SATURDAY, JULY 19TH, 1930

THE WINNIPEG PROGRAMME

On August 22nd, five weeks hence the Canadian Medical Association begins the business of its sixty-first annual session at Winnipeg under the presidency of Professor W Harvey Smith, and three days later members of the British Medical Association from this country and other parts of the Empire assemble in that city as guests of our Manitoba colleagues, for the ninety eighth Annual Meeting of the B M A On August 26th they will be welcomed by the Prime Minister of Canada and the Mayor of Winnipeg and Professor Harvey Smith after installation as our President for 1930-31 at the hands of Professor Burgess, will deliver his inaugural address The Association has only met twice before outside the British Isles and each time in the Dominion of Canada—at Montreal in 1897, and at Toronto in 1906 On this occasion something more than friendship and common ties will unite visitors and hosts because since the year 1924 the two professional bodies by accepting formal affiliation, have come into close organic touch on matters of mutual concern The Winnipeg meeting of 1930 is thus a landmark in Association history Those who are fortunate enough to take part in it will have done something to strengthen the links between the profession at home and the profession overseas and to show that the British Medical Association is Empire wide in its outlook

The revised programme of work for the scientific sections, with a good deal of other information about the arrangements for the meeting appears in our *Supplement* this week Brief particulars of the journey by sea and land and some useful hints for travellers, are also given, but any member proposing to go to Winnipeg should apply at once to the Financial Secretary for a copy of the booklet containing full details of the various tours In general the programme for the Annual Meeting of 1930 follows fairly closely the pattern with which we are familiar on this side of the Atlantic except that all medico political business will already have been disposed of at the Annual Representative Meeting which opens to day at the Association s Headquarters in London The fourteen Sections are to meet on the mornings of August 27th, 28th and 29th, and a very varied and interesting list of subjects, both clinical and scientific, has been drawn up for consideration While the number of set debates is larger than usual and several Sections will combine to discuss borderline topics the occasional paper has not been elbowed out altogether, and (as an example of how hard it is to draw a clear cut line) the subject chosen for the joint meeting of the Sections of Surgery and Tuberculosis is so wide that its discussion might almost as well be described as a series of independent papers, each concerned with a different aspect of thoracic surgery

Some of the social events of the week—they include a skating carnival and an Indian pageant—have a very agreeable air of novelty to English eyes A break with tradition will be perceived also in the announcement of five clinical addresses to be delivered at special afternoon sessions When our brethren in Canada travel long distances to take part in a medical congress they mean business and the chance of hearing an authority from these Islands speak to them on his own subject is in their opinion too good to be missed They expect some fun but work comes first Hence Sir William Wheeler, Dr H C Cameron, Sir Lenthal Cheatle, Professor W E Dixon, and Sir Farquhar Buzzard (whose subject, perhaps chosen in a spirit of gentle irony, is Rest Work, and Play ") may be sure of large and appreciative audiences in the Winter Club on summer afternoons For like reasons, we may suppose, Lord Dawson and Dr Robert Hutchison have been persuaded by the local executive to address a public meeting on the night of August 27th, and the week's proceedings will fittingly close with the delivery of Lord Moynihan s Listerian Oration under the chairmanship of Professor John Stewart of Halifax, a veteran surgeon who was Lister s pupil and friend in Edinburgh and is one of the most admired and respected personalities in the Canadian medical profession

A very warm welcome awaits every member who visits Canada next month Those on this side who have been in constant touch with them during the past two years and more know that the President elect and his immediate local colleagues, Dr J D Adamson, Dr C A Mackenzie and Dr Ross Mitchell are determined to make the Winnipeg meeting memorable in the annals of the British Medical Association and that the Canadian Medical Association, through its general secretary, Dr T C Routley, and its acting-editor, Dr A G Nicholls is co operating in the fullest measure If hard work, enthusiasm, and foresight can ensure success then the ambition of Professor Harvey Smith and company will be realized Canada is very good at organizing affairs, large or small Almost the only thing they cannot guarantee without our help is an attendance from the British Isles worthy of the occasion and of their efforts

THE INCREASE OF MORTALITY FROM CANCER

More than a generation has passed since the late Dr E F Bashford, Mr George King Sir Arthur Newsholme, and others raised the question whether the increase of recorded mortality from cancer were not explicable along lines very different from those which attract the sensation loving journalist How far was a mere ageing of the population, due to falling birth rates and death rates, responsible? What was the part played by improved means of diagnosis? These and similar questions were asked and the official statisticians of many countries have since provided relevant data It may be permitted to an Englishman, in these days of national pessimism, to take some pride in the fact that the contribution made by his own General Register Office has been of first rate importance For twenty years point to point comparison of rates of mortality from malignant disease in narrow age groups has been possible—the best way of assessing the importance of the factor of age—and the useful summarizing figures known as standardized rates have been available Classification by sites has been established and finally, by the application of the method of standardization to these site rates it has become possible for the most casual reader to see at a glance what increase of mortality in each of more than 20 site rates since 1901–10, has occurred independently of the age factor The probable effect of changes in medical knowledge has been examined from various aspects, notably in the

masterly essay which formed part of Dr T H C Stevenson's review of the vital statistics of 1917 Again, the influence of civil state upon mortality from cancer of the breast, ovary, and uterus was examined by Dr Stevenson as long ago as 1913, and in the report of the League of Nations Committee upon this interesting problem the contribution made by the English General Register Office was substantial

The English General Register Office has had two great advantages over most other countries—the absolute bulk of its data and the patient sagacity of the great statistician who sits in Farr's seat But other countries have made progress, and it is gratifying to note that the Registrar-General of the sister kingdom has just published a valuable analysis of Scottish data[1] Dr J C Dunlop set out to assess the shares of (1) ageing of the population, and (2) increasing facilities of diagnosis, in the absolute increase of mortality To assess the age factor, Dr Dunlop has taken the percentage ratio of the sum of the numbers of actually recorded deaths in seven age groups for the year under examination to the sum which would have been recorded had the age-group death rates of 1911 remained applicable This ratio will not in general be the same as the ratio of the death rates for the years compared, standardized by applying them to a fixed set of age groups, but, for technical reasons, the difference is rarely of importance Each method of statement has its own advantages and disadvantages Dr Dunlop finds that about two-thirds of the increase of mortality among males and four-fifths of the increase among females of mortality from cancer between 1911 and 1928 is directly attributable to the ageing of the population Of the residue not so attributable a considerable proportion—he is disposed to think perhaps the whole—*other than that due to cancer of the breast*, may be due to better recognition, and therefore may afford no evidence that cancer is, in the popular sense of the term, increasing In general, the English data, which Dr Dunlop has tabulated in a comparable way, agree with the Scottish, although there are certain interesting divergencies Thus in Scotland cancers of the stomach and intestine show net increases of 13 3 and 21 2 per cent respectively, while the corresponding changes in England are much larger—namely, 22 8 and 46 8 per cent Cancers of the rectum have increased in England by 17 9 per cent , in Scotland only 6 7 per cent Having regard to the rather striking results brought out in the recent English analysis of the site distribution of cancer tabulated by social class, it would be interesting to make a similar study of Scottish data, but the smaller absolute bulk of the data might make this impossible

Dr Dunlop's arguments for attributing rather greater importance to the factor of improved diagnosis than most medical men have been inclined to do are cogent He thinks that *x* ray examination is responsible for the increased recorded incidence of cancer of the lung and histological examination for the increased frequency of cancer of the prostate and ovary There is already a considerable literature dealing with the alleged increase of cancer of the lung, and the opinions of pathologists are divergent There is however a logical difficulty, which Dr Stevenson pointed out in other words thirteen years ago It is this One 'explains' the increase of mortality from cancer of sites *a*, *b*, and *c* by pointing out that, in respect of these sites improved means of diagnosis have become available But then one finds that the rate of mortality from cancer at a site easy of recognition—to quote Dr Dunlop, "it is almost inconceivable that death can be caused by cancer of the breast without the condition being recognized"—has increased quite appreciably, 11 6 per cent in Scotland in 1928, 22 7 per cent in England in 1927 more than can be accounted for by ageing of the population The devil's advocate will certainly say that as the diagnostic explanation will not hold here, perhaps its apparent value in the other cases is only an appearance None of the participants in the discussion on Dr Dunlop's paper seemed to be aware that the statistics of cancer of the breast and uterus have been the object of a special international inquiry Obviously, if we could explain the increase of cancer of the breast and the decrease of cancer of the uterus wholly in terms of measurable differences in sexual activity, then the logical difficulty would disappear, and we should have no qualms over the apparent exception Since the rates of mortality from cancer of the breast are strikingly different in different countries the problem looked a simple one Actually, it proved to be impossible to explain international differences in terms of variations in the proportions of married women There is no doubt whatever that the rate of mortality from cancer of the breast is, age for age, higher among unmarried women than among married women—and Dr Dunlop's figures are no exception to the rule But it does not seem probable that the increase of mortality from cancer of the breast can be satisfactorily explained by any increase in the proportion of spinsters in the female population, although (so far as we are aware) no complete statistical verification has been provided—for example, by standardization for civil state as well as age over a long series of years Hence the difficulty remains We cannot be quite sure that the diagnostic factor is so important as we should like to believe It is to be hoped that Dr Dunlop's paper will stimulate discussion and investigation

[1] *The Registrar-General's Decennial Supplement, Scotland, 1921–30. Part I. The Natural Cancer Death Rate and its Causation.* By J. C. Dunlop, M.D., F.R.C.P.E. *Edin. Med. Journ.* July.

PLACENTAL HORMONES

PROFESSOR COLLIP[1] has published some further information respecting the preparation from placenta of a hormone causing the onset of puberty in immature rats A description is given of the method of preparation which depends on the solubility of the hormone in alcohol or acetone, its relatively small solubility in water and its insolubility in ether A subsidiary method of purification is also described, which consists essentially in adsorption by a colloidal precipitate of calcium phosphate, the active material being recovered by alcoholic extraction The hormone is neither destroyed by boiling for a short time in acid solution, nor by pepsin or trypsin It does not when purified, produce any luteinization of the ovary when injected into rats, thus differing in its action from pregnant urine or implants of anterior pituitary substance There is evidence nevertheless, that crude placental extracts made with acid, and the residue after extraction with alcohol, do produce luteinization in addition to accelerating the onset of puberty thus confirming the suggestion of Wiesner that there are two hormones at least to be extracted from placenta which are similar in action, respectively, to the acid and alkali extracts of anterior pituitary worked with by Evans and his collaborators Collip, however, still inclines to the view that the hormone he has worked with is distinct from the substance which is present in Evans's acid extracts of pituitary and which has a similar action because he finds that the placental preparations are not destroyed by digestive enzymes and are effective when

[1] *Canadian Medical Association Journal*, 1929, xxii, 761

given by mouth, and that extracts of anterior lobe of the pituitary are inactive He is not, however, dogmatic on this point, for there are pitfalls in arriving at conclusions in connexion with this type of research The following table gives a condensed summary of some of the more important results of the injection of various preparations

	Premature Puberty	Formation of Luteal Tissue in Ovary	Production of Gigantism
Anterior pituitary grafts	−	+	+
Acid extracts of anterior pituitary	+	+	−
Alkaline extracts of anterior pituitary	−	+	+
Collip's placental extract			
Pure...	+	−	?
Crude	+	+	?
Residue after alcohol extraction	−	+	?
Urine of pregnancy	+	+	−

Collip proposes the name "emmenin" for the placental hormone that produces premature puberty

FOOD INVESTIGATIONS

UNDER modern conditions foods are seldom consumed at their time or place of origin, and their storage or transport in good condition is not only of hygienic interest, but also, where large quantities are concerned, of the first economic importance It is pointed out in the Report of the Food Investigation Board for 1929[1] that production, transport by sea and land, storage, the wholesale market, and the retail market, are all stages through which much of the food supply of this country has to pass in its progress to the consumer The food industry is not one but many, and its diversity is well reflected in the variety of the problems which have engaged the attention of the Board's investigators during the year One inquiry was carried out in order to ascertain the causes of the loss of bloom during the transport of New Zealand frozen mutton and lamb Thirty one Border Leicester-Southdown cross lambs were slaughtered under supervision, and the carcasses were divided into three lots, covered with stockinette wraps, and frozen at −10° C The first lot were further wrapped in wax paper to reproduce conditions of high humidity, the second lot were left covered by the stockinette wrap only, the third, also covered with stockinette only, were taken out of store to "sweat" at intervals When the three lots, after eighteen weeks' storage at −9·7° C, were sent to Smithfield for the opinion of the trade, the first lot were classed as showing perfect bloom, the second lot as slightly dull in appearance, and the third as most unsatisfactory The first lot realized ½d per lb more than the third The conclusion was drawn that the deficiencies of the second and third lots were entirely due to excessive drying of the muscle Reference is made to previous experiments conducted under the auspices of the Board on the palatability —which includes tenderness, flavour, juiciness, colour, and texture—of frozen beef The tests had suggested that the process of freezing had little injurious effect on palatability, but that the unpopularity of imported frozen beef was largely due to its poor initial quality These views have been confirmed by an experiment organized by the Commonwealth Council for Scientific and Industrial Research, in the course of which quarters of particularly prime Australian beef were frozen in Australia and sent to England for comparison with other samples in respect of palatability, when hot and cold, under cooking tests The Australian quarters were excelled only by prime Scotch home-killed beef, they were found to be better than Argentine chilled, and much superior to ordinary Australian frozen beef Preliminary experiments were carried out during the year on the micro-flora of cold stores In one such store, at 19° F, the air contained only three organisms per litre, and the water melted from the ice round the brine pipes contained only six organisms per cubic centimetre, suggesting that the bacterial contamination of carcasses from aerial sources is under such conditions negligible In the counts the genus Actinomyces was largely represented, though the manner in which it gained access to the store was not apparent Biochemical studies on the action of bacteria on meat at different temperatures added weight to the suggestion, made on other grounds, that it is good practice to cool carcasses immediately after slaughter to a temperature near zero Not only will the growth of any bacteria present be slowed down by the low temperature, but the retardation of autolysis will check the production of the soluble proteolytic derivatives required for bacterial nourishment Studies of the effect of climatic conditions on the storage life of apples revealed no obvious correlation between the complete growing season and the life of the fruit in storage, but good keeping quality was associated with warm dry weather during the few weeks preceding the date of gathering An interesting by-product of the work of the Board's investigators was the disclosure of the fact that a low concentration of acetaldehyde in the atmosphere is useful in fruit storage, inhibiting or killing fungal spores without ill effects upon the fruit itself Another inquiry dealt with the losses of fruit which result from rotting following the invasion of the cut stalks by moulds, with special reference to the suggestion that the treatment of the cut stalks with a fungicide or equivalent preparation would serve as a prophylactic Some thirty substances, including well-known disinfectants, tried in course of the inquiry were found to give no control or to be objectionable on account of their odour Complete success was attained by dipping the ends of the cut stalks in molten paraffin wax The report also contains accounts of investigations on the temperature and wastage of fruit during overseas transport, the freezing and storage of mild-cured bacon, the rate of evaporation from eggs, the corrosion of tin-plate in canning, the refrigeration of fish, and the thermo-physical properties of refrigerants A description is given of a small refrigerating plant for road and rail transport, using a methyl chloride evaporator and potassium chromate brine, which worked well on railway runs between London and Aberdeen The concluding section relates to researches conducted for the Director of Food Investigation by the Imperial College of Science and Technology The whole report is of outstanding interest from the public health point of view

NOISE IN NEW YORK

WE learn from a communiqué issued by Dr Shirley W Wynne, health commissioner for New York, that the Noise Abatement Committee, appointed by him last November to inquire into the complex noise situation in New York City has now presented the first part of its report After a study of the data so far made available through research the committee is satisfied that the continual pressure of strident sound to which New Yorkers are subjected tends to produce impairment of hearing to introduce harmful strain upon the nervous system leading to neurasthenic and psychasthenic states to cause loss of efficiency of workers and thinkers, and finally to interfere so gravely with sound refreshing sleep that rest is difficult and in some cases impossible ' It appears that a medical subcommittee has found definite proof that noise produces undue pressure on the brain, affects metabolism, produces partial or total deafness (upon long exposure), prevents concentration, retards learning both in children and in adults, and interferes

seriously with the normal development of infants and young children As to the effect of noise on efficiency, an investigation carried out by Dr J B Morgan and others showed serious retardation in the productiveness of office workers "The necessity of putting forth extra effort to overcome noise creates a continual strain on the nervous system, which must ultimately show itself in reduced capacity for sustained work, clear thinking, and energetic action, the mainstays of civilized life" In regard to impairment of hearing the report says "The structure of the ear makes it continuously adaptable provided the sounds merge and maintain a more or less uniform level In traffic and many other city noises this is not the case Consequently the portion of the ear which controls adaptation gets no rest After a time the muscles of accommodation, wearied by continual efforts to adjust the hearing to the various thumps, rattles, blasts, and hoots of sound which punctuate the undertone of street noise, fail to react This lack of function leaves a breach in the protection of the ear, opening the way for occupational deafness and causing additional fatigue and other harmful results Here in New York this observation can easily be substantiated Our automobile and taxi drivers are becoming hard of hearing, and the same is known to be the case among boiler workers and other labourers or mechanics exposed to a constant riveting noise" In regard to disturbance of sleep the report declares that a partial abatement of noise during the night will not meet the need of a city as large and diverse as New York the whole chorus of sound must be decreased at all hours "The effects of noise have been described by research workers as 'emotional' Long before the emotions are actively disturbed there are undoubtedly disturbances expressed in heightened pulse rates, increased blood pressure, irregularities in heart rhythm, and, most important of all, in the increase of pressure on the brain Emotion is only the end-product of the process, the undoubted effect of constant noise is a disturbance of the blood vessel apparatus and an increase in the degenerative processes of the heart and arteries" The committee regards the work it has so far accomplished as merely a preliminary to the abatement of noise Nevertheless Dr Wynne is able to report some progress in the direction of actual abatement Following a conference with representatives of the principal steamship and railroad interests and federal and municipal officials, to consider the problem of unnecessary whistling and other noises attendant upon traffic in New York Harbour, the tugboat and steamship companies and others connected with shipping have agreed to take part in the campaign to diminish din from these sources, and officials in charge of fleets of trucks have undertaken to discourage promiscuous horn-blowing by their drivers The nuisance arising from radio loudspeakers is being brought under control by local legislation Henceforward no sound-producing apparatus will be allowed to disturb the quiet or repose of persons in its vicinity, and the use of loudspeakers or other amplifying devices is forbidden in any public street or place without a permit from the police commissioner, or in any case within 250 feet of a school, court house, church, or hospital during the hours when these institutions are [illegible] In addition to these definite steps interest in [illegible] problem of noise in general has been aroused among [illegible] and technical men toward the production of less [illegible] machinery and vehicles, and we have gained the interest and co-operation of newspapers, magazines, and other avenues of publicity Through these channels a general public realization of the costliness danger, and needlessness of increasing city noise has been brought about In making its preliminary survey the committee found that the noise nuisance in cities was by no means a [illegible] through the clamour of modern machinery and [illegible] In other cities particularly in Europe, have made recent studies of the problem, Dr Shirley Wynne takes pardonable credit for the fact that the body set up by him in New York is the first to apply scientific methods to its investigation and to consider the problem as a whole

WAR PSYCHOSES

WAR psychoses, it is generally held, do not conform to specific types differing in their manifestations and origins from the psychoses of civil life They develop in reaction to stresses which differ in appearance but not in essence from the stresses of ordinary life extremes of fatigue and bodily discomfort, constant exposure to danger, to wounds and disease, and to alarming sights and sounds, separation from wife and children, and uncertainty for the future These conditions are known to favour the production of psychoses, the man on active service may be subjected to all of them, and the longer the war lasts the more would their effects accumulate Dr Rodiet and Professor Fribourg-Blanc, from their survey[1] of the psychoses that occurred in the French Army as a result of the great war, reach the conclusion that, though war-time psychoses fall within the usual groups, they differ in some respects from the psychoses of peace-time War has given them, so to speak, a special colouring, and war psychotics show a more intense reaction than the psychotics of civil life The survey in question was undertaken at the instigation of the French Army Parliamentary Committee, charged with the duty of accounting for the country's total losses by reason of death, wounds, mental affliction, and other causes, and though Dr Rodiet and Professor Fribourg-Blanc, after years of painstaking investigation, were unable to make a complete statistical analysis of their allotted field, they have reached a number of valuable conclusions from their study of 25,000 case records collected by the medical staff of the Val-de-Grâce Psychiatrical Centre during and after the war One of their subjects of study was the relative importance of constitutional factors and of conditions which may be directly ascribed to active service in the production of war psychoses Among constitutional factors they instance psychopathic inheritance, mental instability, degenerative states, alcoholism, and syphilis and various organic disorders of the nervous system In the other group they place emotional and "commotional" shocks, extreme fatigue, wounds, and debilitating diseases resulting from war service They do not find themselves in agreement with those who believe that underlying most war psychoses was a constitutional tendency, they hold that factors in both groups were responsible for the production of mental disorder Another matter to which they devote considerable attention is the recruitment of psychopathic persons in time of war In their book they cite numerous instances of magnificent courage displayed in the trenches by soldiers in the early stages of general paralysis, mania, or melancholia When such patients became so severely affected as to render them incapable of further service they were, of course, sent to hospital, but till then they were able to give excellent service

TUBERCULOSIS CONFERENCES AT OSLO AND HAMBURG

THE seventh conference of the International Union against Tuberculosis is to be held this year at Oslo for three days, commencing on August 13th in the Great Hall of the University The formal agenda of the meetings includes three main questions of great interest to tuberculosis workers all over the world The first topic—namely, B C G

[1] *La Folie et la Guerre de 1914–1918* Par A Rodiet et A Fribourg Blanc Paris I Alcan 1930 (Fr 30)

vaccination against tuberculosis—will be introduced by Professor A Calmette of Paris The morning session will be devoted to the principal paper and speeches by Drs William H Park, Maragliano, and others, and the afternoon will be available for general discussion This procedure will be followed in the case of the other subjects The chief speaker on the second subject, thoracoplasty in the treatment of pulmonary tuberculosis, will be Professor P Bull of Oslo, followed by Dr Gravesen of Denmark, Mr Morriston Davies representing Great Britain, Dr Sauerbruch of Germany, and other On the last day the conference will discuss the teaching of tuberculosis to medical students and physicians Professor W His of Berlin will read the first paper, and contributions will be made by Sir Robert Philip, Drs Leon Bernard, Willard B Soper, and representatives of other countries The afternoon is available for general speeches from members of the conference During the week, Dr Heitmann of Oslo will read a paper on antituberculosis work in Norway The proceedings will be conducted in English and French Apart from the intrinsic interest of the formal agenda, there are most attractive motor and railway tours to Lillehammer, Molde, and other beautiful localities where the traveller interested in tuberculosis may sail down solemn fjords and visit ancient churches, tarrying here and there at some well known sanatorium For a minimum of £6, it will be possible, after the close of the conference, to spend a week in this delightful way, substantial railway and steamship concessions being offered to members Further particulars may be obtained from the secretary of the National Association for the Prevention of Tuberculosis, Tavistock House North, Tavistock Square, London, W C 1, to whom application for membership should be addressed On the way to Oslo those who are interested will have a unique opportunity of attending a prior gathering in the Eppendorf Hospital, Hamburg, on August 7th and 8th, which is organized by the North-West German Tuberculosis Association Professor Ziegler of Hanover will be the chairman on the first day, and discussions will take place on nutritional therapy in tuberculosis, the manifestations assumed by tuberculosis during its development, and various aspects of pulmonary disease On the second day, a meeting of the German Research Institution for Tuberculosis will be held, and the topics include the variations in the development of the tubercle bacillus, the surgical treatment of non-tuberculous pulmonary disease, and asthma During the week there will be demonstrations for small groups on respirational physiology, and blood gas analysis Opportunities will be given to visit various sanatoriums and institutions near Hamburg, and modern welfare methods will be demonstrated by the Hamburg Board of Health Applications for membership of this meeting should be addressed to Professor Brauer, Eppendorf Hospital, Hamburg

CONGRESS FOR SEX RESEARCH

THE programme for the second International Congress for Sex Research, to be held in London at the House of the British Medical Association from August 3rd to 9th, is now nearing completion The British organizing committee has endeavoured to provide opportunities not only for consideration of newly established facts, but also for discussion of the bearings of these on modern therapy At the opening session, on August 4th, Professor F A E Crew will give an address on puberty and maturity, and in the afternoon papers relating to this subject will be presented Tuesday morning will be devoted to papers on the biology of testicular and ovarian function by representatives of the Strasbourg and Chicago schools, including Professors Bouin, Koch, Carl Moore, and Gallagher and these will be discussed in the afternoon On Wednesday morning papers on hormone therapy will be presented by members of the Breslau and Kiel schools, including Professors Frankl, Fels, and Schroder On Thursday morning, it is proposed to discuss the subject of psychology and biology Friday morning will be devoted to papers on the biological and therapeutical aspects of the control of human fertility, and reviews of the work that is being done in various countries in this field The subjects of papers to be presented to sectional meetings include the Aschheim Zondek test for pregnancy, by Professor Aschheim of Berlin the corpus luteum hormone, by Dr Clauberg of Kiel, biological tests of the female hormone (menformone), by assistants from Professor Laqueur's institute in Amsterdam, the channels and significance of excretion of the female sex hormone, by Professor R T Frank of New York, the male sex hormone, by Professor S Loewe of Mannheim, evidence for the metabolic basis of sexuality, by Dr Oscar Riddle, and human hybrids, by Professor C G Seligman An attempt has been made so to plan this programme that there shall be in it much that should interest the medical practitioner Membership of the congress is restricted to professional biologists engaged in research or teaching in accredited institutes of anatomy, anthropology, botany, medicine, physiology, psychology, sociology, veterinary science, or zoology, and to members of the medical profession Those who wish to become members should communicate with the congress secretariat, King's Buildings, the University, Edinburgh, until July 26th, and thereafter at the House of the British Medical Association, Tavistock Square, London, W C 1.

THE UNIFORM OF NAVAL MEDICAL OFFICERS

IT is well known that a uniform dress for commissioned officers of His Majesty's Navy was authorized in the year 1748 It is perhaps less well known that the service had a narrow escape from being clad in a combination of grey and red instead of the famous blue and white The regulations of 1748 did not apply to medical officers who were appointed by Admiralty warrant and it was not till 1787 that the *London Gazette* specified for the first time a uniform for "warrant officers and masters' mates" This document is referred to in the April number of the *Mariners' Mirror* (the organ of the Society for Nautical Research, published by the Cambridge University Press) It was not, however, until 1805 that definite rules were promulgated Upon a proposal from the Commissioners for Sick and Wounded Seamen, the Admiralty obtained an Order in Council, dated January 23rd, 1805, revising their rates of pay, etc The Admiralty memorial contains the following "And the Commissioners having further submitted to us the propriety of allowing the medical officers to wear a distinguishing uniform during the time of their being actually employed, and of giving them a comparative rank in the service suitable to their situation to which consideration it is believed they attach much importance, especially as the regimental surgeons are allowed to rank with captains" The Scheme of Uniform put forward by the Commissioners was accepted by the Admiralty in May, 1805 It specified full-dress and undress for physicians, surgeons, dispensers of hospital, assistant surgeons and hospital mates All medical officers to wear the word established for officers of the Navy It is to be noted that only physicians were allowed gold lace half an inch wide round the cuffs and collar There is no description of the hat but that is not remarkable because it is on record that years later no colour was specified for a post-captain's hat and that excellent but eccentric officer Sir John Phillimore (died 1840) once visited My Lords of Whitehall in a white one, in order to emphasize the omission

NEURO-HYPOPHYSEAL MECHANISMS FROM A CLINICAL STANDPOINT.

LISTER MEMORIAL LECTURE

THE Lister Memorial Lecture was delivered by Professor HARVEY CUSHING at the Royal College of Surgeons of England on July 9th, with the President, LORD MOYNIHAN, *in the chair*

Professor Cushing said that Lister was that rare combination, a surgeon and a savant, the high esteem in which science was held at the Royal College was indicated by the true savants who, from Richard Owen to Arthur Keith, had been conservators of the Museum

The central nervous system lay within a bony case, protected by tough membranes and the pituitary body, *like a nugget in a series of Chinese boxes*, had a special membranous and bony case of its own Why had Nature thus safeguarded it? Galen had thought it to be a filter for the escape of pituitary humours to the nose Willis, *in the seventeenth century*, said that "the blood before it is let into the cerebrum takes some part of the superfluous serum of the pituitary gland," but later this conception was swept away by the belief that the organ was a vestigial remnant It was not until it was discovered that acromegaly and gigantism were usually associated with an hypophyseal tumour that interest in the gland revived Of late years French and American workers had stimulated interest in the interbrain, and some symptoms formerly thought to be due to lesions of the pituitary were now said to depend on lesions of the hypothalamic region He wished to bring these divergent views into association

The adenomata of the pituitary, in the first place, were of three types, and of these, two were associated with evidence of glandular hypersecretion Adenomata in general, long regarded as curiosities, were proving to be of disturbing physiological significance Cases of cystic degeneration of bones were being found to depend on adenomata of the parathyroids Adenomata of the islet cells of the pancreas led to a condition resembling overdosage with insulin The two common types of pituitary adenomata arising from the anterior lobe were the chromophil cell type, associated with acromegaly, and the chromophobe cell type, associated with arrest of growth and adiposity—the reverse syndrome to gigantism But both these syndromes were associated with reduction of the reproductive function, which at first sight seemed unreasonable It had been demonstrated by Evans of California, however, that an emulsion made from the anterior lobe and injected into female rats interrupted the reproductive cycle, and later it was demonstrated that two hormones were obtainable from this portion of the gland one which was concerned with growth, and one with reproduction The basophil cells of the anterior lobe were responsible for the reproductive secretion, and were, of course, compressed and destroyed by either of the foregoing adenomata arising within the sella turcica An adenoma of these basophil cells, however, gave rise to the condition of virilism

The recent researches on the hypothalamus had rather overshadowed theories of the function of the posterior lobe of the gland, but he would attempt to restore some of its interest In any case it was probably intimately associated with the diencephalon in relation to the haemodynamic, oxytocic antidiuretic, pigmentary, antipyretic, and sudorific functions Experimental results obtained by extirpation of the posterior lobe had been attributed to accidental injury of the hypothalamus during the operation, and it had even been doubted whether the destruction of the hypophysis had anything whatever to do with these results In the rat, however, it was possible to approach the pituitary without injuring the brain, owing to the existence of a diaphragm similar to that covering the sella turcica in man P E Smith had taken advantage of this fact to show that lesions of the pituitary alone gave rise to interference with growth and sexual development, but that injuries to the tuber gave rise to adiposity Richter had shown that a stab wound just anterior to the hypophysis in the rat gave rise to persistent polyuria

But though this would seem to give a definite hypothalamic as opposed to an hypophyseal syndrome, it should be remembered that from the supraoptic and paraventricular nuclei of the diencephalon non-medullated nerve fibres passed down the infundibulum to ramify in the posterior pituitary lobe and its epithelial investment It was impossible to speak of diencephalic lesions as separate from the pituitary Herring described, in 1908, the invasion of the posterior lobe by cells from the pars intermedia and the transformation of these cells into hyaline bodies which appeared to pass towards the ventricle, mechanical obstruction of the hypophyseal stalk led to a damming back of this hyaline material There was evidence that this material represented a secretory principle which possibly affected the nerve centres of the hypothalamus It had been found that a small silver clip placed on the infundibular stalk, without inflicting injury on other structures, led to a persistent polyuria *which lasted until the animal was sacrificed two years* later Polyurias produced by injuries to the hypothalamic region could be counteracted by the injection of extract of the posterior lobe, suggesting that this portion of the gland lay under the control of the nerve centres injured

Deposition of fat was more marked after injuries to the diencephalon than after extirpation of the posterior lobe, but occurred in both cases

Temporary glycosuria might be produced both by hypophysectomy and by hypothalamic injuries The glycosuria provoked by Bernard's piqûre depended only on the injury in the fourth ventricle of a relay station for glycogenolytic impulses originating higher up In the glycosuria of acromegaly possibly the neural portion of the gland was activated, giving rise to hyperglycaemia and glycosuria Injuries to the hypothalamus might also produce dystrophia adiposo genitalis, possibly a functional discharge in this region normally acted on the anterior lobe of the gland to free the reproductive secretion Temperature regulation was disturbed by hypothalamic injuries Sleep appeared to be controlled by the diencephalic centres, as Hess had shown by inducing sleep in cats on stimulation of a certain hypothalamic area Encephalitis lethargica which struck chiefly at this region, led to disturbances of sleep, but somnolence was also associated with deficiency *adenomata of the anterior lobe*, when the diencephalon appeared to have escaped injury

The diencephalon represented the primitive emotional region Removal of the upper parts of the hemispheres in a dog led to a complete change of character the animal became extremely irritable, and exhibited bursts of "sham rage," in which the blood pressure rose and blood sugar was increased The primitive emotional mechanism was here acting uncontrolled by the higher centres The pituitary body was developed from a downgrowth of this most primitive part of the brain—a part which existed in any organism which could be said to have a brain at all—and from an upgrowth of the buccal epithelium If, in the tadpole, the buccal portion was removed at an early stage, pigmentation disappeared, the fat organ persisted, and metamorphosis did not occur the infundibular portion of the gland failed to develop, it required to come into *contact with the buccal epithelium before its normal* growth would take place Furthermore, if the buccal portion was transplanted it did not develop unless a part of the nervous tissue were included with it

Only occasionally did pituitary tumours evoke a definite march of symptoms This had been observed in the case of a girl 13 years of age, who suffered first from an oculomotor palsy and subsequently from blindness of her right eye A radiograph suggested suprasellar tumour, and on inquiry a history of polydipsia, polyuria, temporary adiposity, and somnolence was discovered Vision later became impaired in the other eye and was followed by a progressive change in personality, the child becoming uncontrollable Persistent fever, ranging from 101° to 104°, arose and persisted for ten weeks At operation a malignant glioblastoma was found, involving the chiasma

and spreading into the ventricle She died forty-eight hours later in a state of hyperthermia with a rectal temperature of 108°

After summarizing his points Professor Harvey Cushing concluded by saying that though information might be gained by study of the independent parts of the diencephalo-hypophyseal mechanism, it could only be properly interpreted, philosophically at least, when looked on as a whole and in relation to the entire organism He quoted Thomas Willis, who said of the rete mirabile "There is no thing in the whole fabric of an animal body more worthy of admiration nothing can be conceived as more skillful and nothing which argues more forcefully the providence of a highest author"

BACTERIOLOGICAL CONTROL OF WATER SUPPLIES

PROFESSOR J M BEATTIE'S ADDRESS TO THE BRITISH WATERWORKS ASSOCIATION

AT the nineteenth annual meeting of the British Waterworks Association, which was opened at Liverpool on July 9th, Professor J M BEATTIE, M D, professor of bacteriology, Liverpool University, and bacteriologist to the city and port of Liverpool, read a paper on the value of regular and systematic examination of water and the interpretation of results

The practice at Liverpool, as Professor Beattie explained, is to examine daily the water as supplied to the city, and to examine monthly the water from the storage reservoirs at Prescott and from the deep wells Samples are taken at less regular intervals from various parts of Lake Vyrnwy, the artificial reservoir in Montgomeryshire for the water supply of Liverpool, also from the principal feeders of the lake, from several points along the course of the pipe line from Vyrnwy to Oswestry, where are the filter beds, and at Oswestry from both the unfiltered and the filtered water It was in 1887 that the first arrangements were made for a systematic examination of the bacteria in Liverpool water, and at that time a routine daily examination was not practised in any other large British city

Professor Beattie addressed himself to the question whether this method of investigation was really necessary and afforded any important information

Multiplication of Bacteria in Water

The main object of the examination, he said, was to determine whether the water had been subjected to faecal contamination, and, in consequence, whether it was possible that various disease producing organisms, such as those of enteric fever, dysentery, and cholera, were being distributed over the area of supply Another factor of importance was that bacteria flourished best in water which contained organic impurities, thus a bacterial count might give important indications as to the amount of such impurity If the amount was considerable the water became a more favourable medium for bacterial growth, and if, by chance, the water in this condition became contaminated with faecal organisms, their growth would be more active and their multiplication more extensive On the other hand, if the organic impurity was small in amount, the chances of disease-producing organisms multiplying would be considerably lessened, and the risk of infection correspondingly diminished A systematic examination, therefore, enabled the water to be kept at "the minimum point of risk"—that is to say, in such a condition that the disease-producing bacteria, if they gained access, had little chance of surviving or multiplying

Some American investigations were cited in the paper, showing how important a part was played by food materials (organic matter) in the multiplication of bacteria in water Temperature was another factor to be considered but its effect varied with the amount of organic matter present A rise of temperature favoured bacterial growth if the water contained an ample food supply but when the organic matter was small in quantity a rise of temperature actually caused a diminution in the number of organisms Regular information regarding the total bacterial count of a water supply was thus a very important indication to the water engineer, not merely as to the immediate purity of his supply, but as to the capability of the water for dealing with a chance contamination of disease-producing organisms

Sporadic Infection Due to Water Supply

Granted that epidemic disease from water supply was a rare occurrence, this was not to say that contamination with disease-producing bacteria was also uncommon It might be that these organisms occurred in water supply more commonly than was thought, but if the supply was a really satisfactory one, no epidemic would follow, owing to the difficulty of the organisms in surviving or multiplying It was very common in any city to find isolated cases of typhoid or paratyphoid in which no cause of infection could be traced Could a clear verdict be given that the water supply was not responsible? In a properly controlled water supply these pathogenic organisms would be few in number and not uniformly distributed, so that, unless the contamination was marked, they were likely to give rise only to isolated cases of infection Even a universal agent like the water supply might be the channel of sporadic infections while still not giving rise to any epidemic. No system of bacteriological examination could prevent isolated cases of infection, but in the absence of regular examination such a source of infection would remain undiscovered and isolated cases go on indefinitely

In one city, in 1924, as many as twenty-four cases of paratyphoid were notified, as compared with sixteen for the five preceding years. The occurrences suggested that the agent responsible was something widely used, but not heavily infected The cases occurred during the early part of the year, and in the latter part of the previous year the *B coli* content of the water had been high and remained so This led to investigation in which organisms of the paratyphoid type were isolated Probably these organisms were the causal factor of the outbreak, but the search for them was wholly dependent on the regular examination of the water and the finding of excessive numbers of *B coli* continually over a period If a medium were available by which pathogenic bacteria could be isolated from water an enormous advance would be possible, a single examination in such a case being sufficient, but although there was a medium useful for the isolation of *B typhosus* from the stools and from ordinary sewage, its value in bacteriological examination of water was not established

Standards of Purity

Professor Beattie complained of medical officers of health that too often they had a notion that the presence of *B coli* in less than 100 c cm of water was a serious matter It was said that this was "Houston's standard," overlooking the fact that Houston had always asserted that the standard was only tentative, and to be controlled by knowledge of local conditions One American bacteriologist had declared that the discovery of a colon bacillus in 50 c cm of water, or even occasionally in 5 c cm, afforded no reasonable ground for casting suspicion on the character of the water The possibility of contamination with colon bacillus derived not from man but from domestic animals and birds had to be borne in mind A commission appointed in the United States had established the standard that "not more than one out of five 10 c cm of any sample examined show the presence of *B coli*" In Professor Beattie's view, this was quite a good working basis if used with an intelligent knowledge of local condition and particularly if the conditions were more or less constant for a few days

Filtration Action of Ultra-violet Rays

Passing to some other points Professor Beattie said that ordinary sand filtration not only removed large quantities of bacteria but also much of the organic material whereon the bacteria lived Houston had shown that sand filtration, after storage of the water for thirty days, removed 98 per cent of the residual bacteria But filtration must not be taken as a certain means of getting a pure supply It was

only after the filter had been in use for a short time that it reached its maximum efficiency, and, further, this efficiency was not of very long duration

As to the claim that ultra-violet radiation from the sun played an effective part in destroying bacteria in water, Professor Beattie said that that view had been supported by laboratory experiments, in which, however, the water was exposed in shallow vessels In nature these conditions did not obtain The opacity of the water prevented penetration of the rays In open storage reservoirs where the water was clear and the rays of the sun penetrated a distance probably of three or four feet, there was a certain amount of effect, but the sun in Britain could not be regarded as a serious agent for bacterial purification of water supplies

In conclusion, Professor Beattie repeated that the real object of a bacteriological examination of water was to ensure a supply free from disease-producing intestinal organisms For many years typhoid was the disease against which it was specially desired to guard, more recently the paratyphoid fevers had taken its place Dysentery, particularly the bacillary form, had become much more common within the last few years, and some food-poisoning organisms—for example, Gaertner's bacilli, which were not uncommon in the lower animals, such as mice and birds—had been found in the water supply Regular and thorough examination was essential, but the interpretation of the results called for special care and experience

Ireland.

New Lectureship at Trinity College, Dublin

THE Board of Trinity College, Dublin, has received from Miss Sarah H Purser a sum of money to bring in £100 per annum in order to found, as a permanent memorial to her brother, the late Professor John Mallet Purser, a lectureship in connexion with the School of Physic A lecture will be delivered each year, dealing with some scientific subject in which he was interested Dr Purser occupied the chair of the institutes of medicine (physiology and histology) in the School of Physic for twenty-seven years, and for eight years was Regius Professor of Physic He organized the first instruction in practical pathology which was given in Dublin, and his lectures and clinical teaching are still remembered with gratitude by his former pupils Several years ago he made a gift of £10,000 for the advancement of medical and scientific education in the University, and the interest on this sum has been the means of providing additional apparatus for teaching in those departments which undertake practical courses The Purser Medal, which was founded in the year 1899 by his former pupils, and is awarded annually in the subject of physiology, bears on the obverse an excellent likeness of the late Regius Professor

Public Health Conference in Dublin

On the invitation of the Minister for Local Government and Public Health (General R Mulcahy) representatives from all the County Health Boards in the Irish Free State met recently at a conference in Dublin The Chief Medical Officer, Dr E F Stephenson, was present, as well as the county medical officers of health of the Irish Free State General Mulcahy, who presided, said, in the course of his address, that it was the first occasion on which representatives of all public health authorities in the country had assembled at such a conference, and he hoped that it would be the forerunner of many more Since the opening of the present century a marked decrease had taken place in the number of deaths caused by preventable disease Some of the diseases that formerly ravaged the country had almost disappeared, the mortality caused by others had been enormously reduced Small-pox, which was responsible for over 6 000 deaths in Ireland from 1870 to 1880, had not appeared in the mortality returns for twenty-three years Typhus, enteric, and scarlet fever had been greatly diminished Pulmonary tuberculosis had been definitely on the down grade for over twenty-five years The general death rate had fallen from 18 per 1,000 in 1871 to 1880 to 14 per 1,000 in 1928, and the census revealed that the expectation of life, which had remained almost stationary between 1870 and 1900, was greater at all ages and for both sexes in the first quarter of the present century This record, said General Mulcahy, encouraged the hope that many of the diseases that still afflicted the community would be mastered in time Progress could not be attributed to any single cause Better housing, purer food, more widespread knowledge of the laws of healthy living, better organization of public health work, had all played a part in the advance, side by side with the increased knowledge that medical science had placed at their service They should not, however, look back too complacently, for the Registrar-General's returns showed that tuberculosis, heart disease, influenza, bronchitis, and pneumonia still carried off thousands every year The mortality figures did not indicate the amount of invalidism, disability, and physical defect that reduced and destroyed the happiness and well-being of thousands, or the economic loss of avoidable physical impairment Public health involved more than the promotion of water and sewerage schemes, and the isolation of infective disease. These activities were as important as ever, but communal activities must also be directed towards improving the health and well-being of the individual Prevention was better and cheaper than cure The wise development of the preventive side of public health was more of an investment than an outlay Under the child welfare schemes, and in the school, the medical side of the public health service did most valuable work in discovering conditions that brought about ill-health in adult life

Dr. J C Saunders, medical officer of health for the City of Cork, read a paper on health education and the methods by which it could be promoted He said that the greatest stumbling-block to the promotion of health education was the fact that health legislation was generally years ahead of public opinion Prevention of disease, he said, was only now taking hold of the people, but it was becoming of greater importance every day Attention to the smaller ailments of children, such as enlarged tonsils, adenoids, defective teeth, and other ills, would go a long way towards preventing disease in later life Parents still objected to vaccination and to sending their children to an isolation hospital Although vaccination had been proved to be the greatest preventive of disease, yet there were people who objected to it Comparison of the outbreaks of small-pox in Ireland and England, where only 30 per cent of the children were vaccinated, showed what vaccination had done for the health of the Free State Communal hygiene, he contended, should be national rather than local, and should be put into effect by a central organization Dr B O'Beirne, medical officer of health, Galway, said that *infectious disease* cost the ratepayers of Galway over £3,000 a year Insurance companies had a lot of money in hand, and if they expended less on benefits through improvement in public health they ought to be prepared to lend money for this purpose to the authorities concerned, at a low rate of interest Dr R Condy, medical officer of health for Cork County, in the course of a discussion on county health administration, advocated the replacement of the present part-time office of subsanitary officer by a fully trained whole-time service He realized the difficulty of a county medical officer of health taking over the functions of an executive sanitary officer, although this was desirable in some respects Dr Condy referred to the proper production and handling of milk, meat, and other foods which directly concerned the county medical officer in the protection of the health of the people Where the circumstances of the area made it possible, as in urban areas and large towns, by-laws providing for a system of inspection and stamping of all meat before sale should be introduced, urban powers being obtained when necessary Inspection at the time of slaughter was of special importance, and in the absence of public abattoirs could best be carried out by the mutual co operation of the veterinary officers and victuallers The employment of untrained sub officers for milk inspection was unsatisfactory Special training and experience was necessary for this work, which should preferably be in the hands of qualified veterinary surgeons in order to gain the confidence and co operation

of the farmer The annual report of the county medical officer of health should be the chief medium for giving public information about the Health Department and about the character and extent of the health work done over a given period

Dr Harbison medical officer of health, Kildare, said that the county medical officer of health should be the book keeper and auditor of the health of his community He must report fully to his board, and through it to the community, the vital statistics indicating preventable wastage of life and the results of the efforts to improve health and save life The medical officer had also a vital part to play in the health education of the people The expense was only a secondary thing if they could wipe out disease in the country The generous financial aid given towards housing by the Government was doing a lot to eliminate the white plague, and he hoped that housing grants would be made in an even more generous way in the future Dr M Russell medical officer of health, Dublin, Dr T F Higgins, medical officer of health, Meath, and Dr McDonnell of the Public Health Department, also took part in the discussion Dr M M O'Leary, school medical officer, Dublin, in a paper on the health of the school child said that the hygiene of the growing child was scientifically of more importance to the nation than that of the adult Owing to the large school population (between 50,000 and 60,000) and the small staff of two medical officers engaged in the work, the system so far adopted in Dublin had been in the nature of a general survey All children with any defects, obvious to parents or teachers, were examined irrespective of age In addition, all apparently normal children were examined in three routine age groups—entrants aged 5 to 6 years, intermediates aged 8 to 9 years, and leavers aged 12 years and over By this means it was hoped no child would escape inspection From the point of view of the school medical service, rheumatism was one of the most serious defects of the school child, leading to prolonged absences from school and chronic invalidism, permanent crippling, or early death from heart disease The discovery and removal of diseased teeth and tonsils seemed a small price to pay to ensure against the disastrous consequences of this neglect

Scotland.

Radium Supply in Scotland.

SEVERAL medical institutions in Glasgow have now organized their services for the treatment of cancer by radium. As recently mentioned in these columns the Glasgow Royal Cancer Hospital, with the help of a gift of £10,000 from Lady Constance Burrell, purchased a quantity of radium in November, 1928, to augment its original supply A central department of the Glasgow and West of Scotland Radium Committee at Glasgow University has possessed for a number of years about 700 mg of radium acquired at a cost of about £9,000, from which radium emanation is still supplied to the three infirmaries of the city, as well as to the Royal Cancer Hospital and Royal Samaritan Hospital In 1928 the Western Infirmary, as the result of a gift of £5,000 from Sir Henry and Lady Mechan, obtained a supply of radium which was sufficient at that time for the immediate requirements of the Western Infirmary By special arrangement this supply has also been available to the hospital staff for the treatment of private patients, its administration being under the charge of Dr A A Charteris, the Donald research scholar in the latter institution The Glasgow Western Infirmary was subsequently selected by the National Radium Commission after consultation with the medical faculty of Glasgow University as the National Radium Centre for the West of Scotland, and the Infirmary has received the first consignment of radium allocated to it in this capacity The National Radium Commission was constituted about a year ago after a successful appeal had been made for a National Radium Fund Two bodies deal with this Fund the Radium Trust and the Radium Commission the Trust being charged with the duty of purchasing the radium, and the Commission with its custody, distribution, and use After consulting the medical faculties of the different medical schools, the Commission selects an institution as the national centre for a given part of the country The centre for the East of Scotland is the Royal Infirmary of Edinburgh, which received its supply of radium about three weeks ago In each case the Government supply of radium will be used in the respective hospitals only for purposes of research and treatment, while the rest of the radium belonging to the hospitals will be employed at their discretion for outside work as well Other national radium centres have still to be established

Retirement of St. Andrews Professor

A meeting of St Andrews University Court was held on July 9th, when a letter was read from Professor Lewis Robertson Sutherland intimating his resignation from the chair of pathology as at September 30th next It was agreed to make interim arrangements for carrying on the work of the department during the coming academic year and to defer taking steps to fill the vacancy Professor Sutherland graduated M B , C M at Glasgow University in 1890, and after a period of study abroad became assistant to the professor of pathology at Glasgow University and demonstrator of pathological anatomy at the Western Infirmary, as well as pathologist to the Royal Hospital for Sick Children, Glasgow He was appointed to the chair of pathology at the University of St Andrews in 1899, and at the same time became pathologist to the Royal Infirmary of Dundee His name is well known as the editor of recent editions of the *Manual of Pathology*, originally produced by Professor Coats of Glasgow At the same meeting Dr Walter F Harper, B Sc Ph D , was appointed full time assistant in the department of anatomy at Dundee, Dr F M T Skae remaining a part-time assistant It was also intimated that Emeritus Professor Musgrove (formerly Bute Professor of Anatomy in the United College) had presented an epidiascope to the department of physiology

Cremation in Scotland.

The ninth annual conference of the Federation of Cremation Authorities in Great Britain was held in Edinburgh on July 5th and 7th Bailie John Dickson welcomed the delegates on behalf of the Lord Provost and Corporation It was evident he said, that the Cremation Society was making great progress in spite of the difficulty of changing public opinion Progress, however, had not been so rapid in Scotland as in England Mr J Dan Easson secretary of the Edinburgh Crematorium, mentioned that in the nine months during which this crematorium had been in operation, 86 cremations had been carried out—31 of these at a reduced rate He suggested that standard forms should be adopted by all cremation authorities containing printed instructions to doctors in regard to the terms of their certificates Dr A A Mussen, medical officer of health for Liverpool, said that most medical men were in favour of cremation, and it would be a good thing if medical students were instructed in their final year regarding the statutory regulations and the necessary certificates It was stated that in Edinburgh the charges for a cremation, including the fees for medical certificates amounted to less than £15, including carriages Professor Sydney Smith of the forensic medicine department of Edinburgh University, speaking on the subject of cremation and crime referred to the question whether the present regulations under the Cremation Act were sufficient to prevent the concealment of crime Two medical certificates he said were necessary the first contained about nineteen questions, the second which was a confirmatory certificate had to be filled up by an independent doctor The two certificates were then passed to a medical referee who decided whether cremation could be carried out In the majority of deaths no suspicions could possibly arise, and where death was due to poison, the sudden onset of characteristic symptoms in a previously healthy person terminating rapidly in death was sufficient to arouse the doctor's suspicions Where poison had been taken in small doses over a long period, the doctor again was almost certain to have his suspicions aroused by the symptoms, or if improvement in the patient's condition coincided with

his absence from the source of poison In such a case, if cremation were demanded, an immediate examination would be necessary Professor Smith referred to the Chapman poisoning case of 1903, where the sudden death of a girl, after symptoms suggesting poison, had called for an examination both in this case and in that of two women with whom Chapman had been previously associated These two bodies having been exhumed and examined, Chapman was found guilty of three murders At the trial the judge remarked that if cremation had been employed the discovery of Chapman's previous guilt would have been impossible It was pointed out, however, that if cremation had been asked for in the case of the first woman poisoned by Chapman, the circumstances of death could not possibly have escaped notice, and Chapman would have been found guilty there and then Cremation might therefore be regarded as an actual preventive of crime Colonel P S Lelean, professor of public health in the University of Edinburgh, speaking on "dissolution," remarked that two-thirds of the human body consisted of water, which evaporated after death, while the body tissues were slowly resolved into their simple elements, so that finally there remained only about two and a half pounds of solid mineral matter, or in the case of cremation, of ash In the cremation chamber, with a temperature of 1,600° C, the gaseous elements were immediately converted into innocuous products The result was more quickly achieved than by the slow process of natural decay During the last five years, he said, approximately twenty-five acres of land in Edinburgh, which would have provided playgrounds for children, had been wasted on the burial of corpses If it were true, as alleged, that 4,000,000 children in this country had no ground on which to play, it was criminal that land should be uselessly employed for the interment of the dead The tradition of incineration was an old one among the Romans and Greeks, who saw in the smoke of the funeral pyre the ascent of the spirit Incineration would strike a blow at the morbidity which surrounded a graveyard

Training of Scottish Nurses

At the annual meeting of the Edinburgh Club for Nurses an address was delivered by Dr J Pailane Kinloch, Chief Medical Officer of the Department of Health for Scotland Dr Kinloch said that certain aspects of the training of nurses required consideration as a result of the new Local Government Act The supply of trained nurses was not affected, but there was evidence that they were emigrating in large numbers Prospects were better for them abroad than at home, and it was expected that there would be a serious shortage of trained nurses in this country before long It was satisfactory that Scotland should be a training ground of nurses for a wider area, but measures must be taken to prevent a consequent deficiency in this country In his opinion, the requisites were better organization of training, better status for the trained nurse, and increased remuneration for her work Hitherto there had been a complete separation between the nursing and teaching professions, he thought that they must co-operate more and more There were important differences in the training of a nurse and of a doctor The medical student had five years' intensive training in the whole range of medical experience, but a woman who wished to take up nursing and to reach the head of this profession had to spend three years in a general hospital, three years in a fever hospital, six months in maternity training, a period in studying mental disorders, and so on Practically she had to spend about ten years as a pupil before she could become an all-round nurse this was an impossible state of affairs The representatives of the nursing profession must devise a far-sighted policy to provide nurses with a comprehensive training He regarded the Queen's Institute of District Nursing as the chief institute for training the public health visitor but local authorities in the principal towns had largely trained their own health visitors, here again there was an evidence of lack of contact There had been a tendency to make the h[illegible] social worker at the expense of nursing proficiency, and this was quite wrong He regarded nursing as the ideal profession for women, but at present it was not so well organized as the teaching profession, for many suitable recruits were lost during the interval between leaving school and the commencement of their training He suggested that it might be possible for the nursing colleges to recruit girls at the age of 16 or 17 They would get preliminary instruction in biology, physics, chemistry, anatomy, and hygiene At present studies had to be undertaken along with a hard day's nursing After such preliminary training, they could at the age of 18 take up general hospital work for a year, and afterwards pass to fever and maternity hospitals, so that at the end of four or five years they could have a wide training in nursing and in preventive medicine This would call for a spirit of accommodation all round in hospital work, but it would raise nursing to a higher level

England and Wales.

The New Queen Charlotte's Hospital

THE first section of the new Queen Charlotte's Maternity Hospital, in Goldhawk Road, Hammersmith, was opened by Princess Mary, Countess of Harewood, on July 10th The new institution, which will be the largest maternity hospital in the British Empire, and will form with its abundant clinical material and provision for research a sort of staff college for the maternity service, is to consist eventually of a number of buildings grouped around a central lawn, the whole site being five acres in extent The principal frontage will be occupied by the administration offices, the students' college, and the nurses' home To one side of this will be an out-patients' block, with ante-natal and infant welfare departments, all on one story, at the rear an isolation block, consisting of three stories, and beyond this the research laboratory On the other side will be the main hospital, containing 248 beds—a 100-bed unit at each extremity, and a labour ward of 48 beds in the centre Elsewhere in the grounds there is to be a middle-class paying patients' block, of five stories, with from 80 to 100 single-bed private wards The work on the isolation block, for puerperal fever cases, has been carried through in advance of the rest of the construction, and it was this block which was opened by Princess Mary Each of the three stories comprises a five-bed ward, five single-bed wards, and a nursery for ten infants The wards have french windows opening on to broad balconies facing south The Princess was received by the president of the hospital, Lord Howard de Walden, and the chairman of the National Mother-Saving Campaign, Lady Howard de Walden After the hospital had been dedicated "to the Glory of God and in Memory of Her Majesty Queen Charlotte" Sir Almroth Wright, a member of the consulting staff, stated that the present building would be devoted to the treatment and study of puerperal fever, which was responsible for very many of the deaths of women following upon childbirth The number of such deaths was not diminishing, and it was necessary to look for new resources in dealing with this baffling problem of infection He described his own continual disappointments during the forty years in which he had been engaged in research work in connexion with infections conveyed by micro-organisms Princess Mary, having received a golden key from the architect, Mr E Stanley Hall, unlocked the door of the isolation block and declared the building open Thanks were expressed to Her Royal Highness by Sir Samuel Scott, chairman of the committee of management, and by the Mayor of Hammersmith Among those presented to the Princess were Mrs Philip Snowden (vice-chairman of the National Mother-Saving Campaign), and the following medical men Dr T Watts Eden, Dr A W Bourne, Dr Trevor B Davies, Dr L C Rivett, Dr L G Phillips, Dr C S Lane-Roberts, Dr L H W Williams, Dr [illegible], and Dr Eric Pritchard

Cancer Research in Yorkshire

The annual report of the Yorkshire Council of the British Empire Cancer Campaign has now been published. Details are given of the satisfactory progress which has been made in general administration and scientific research. Sir Harold Mackintosh on behalf of the honorary secretaries remarks that in view of the generous response to the appeal for financial support the previous concentration on collecting funds has given place largely to attention to the question of directing as widely as possible the expenditure on cancer research. New moneys received during the year under review amounted to £1 828, the smallest amount yet contributed, but obtained without any active efforts, the hope is expressed that the Campaign will continue to benefit by such unsolicited and welcome support. Actual research absorbs 67 per cent. of the expenditure, the remaining 3 per cent. being devoted in equal proportions to propaganda and administration. Professor R. D. Passey, who contributes a report on behalf of the department of experimental pathology and cancer research in the University of Leeds, states that Dr. Young has continued his work on experimental hyperplasia, and that more evidence has been accumulated in favour of the view that simple proliferation in the pulmonary epithelial cells of the rabbit is governed by physico-chemical principles. Details are given of experiments designed to elucidate the nature of the action of heavy metals on the living cells, and the development of "tissue immunity" to solutions of neutral salts such as strontium and calcium chloride. Dr. Berenblum has obtained evidence that when two cancer-inducing agents are applied concurrently to the same area of skin the result may be a mutual inhibition though when each is applied alone for a certain period a summation of effect may result. During investigation of the action of mustard gas it was observed that the epithelial hyperplasia which develops invariably during the initial stage of tarring experiments continues when mustard gas is added to the tar although the ultimate development of the tumours is inhibited, thus providing a good example of a continued state of hyperplasia which does not necessarily develop into neoplasia. The reputed inability of blast-furnace tar to produce tumours was tested and was not substantiated, though its carcinogenic activity was found to be less than that of horizontal retort gas tar. Experiments on the Rous tumour in fowls have been repeated during the year under review, it is concluded that infections from bird to bird rarely take place under reasonable conditions of housing, unless opportunity is offered for direct transmission by pecking. Dr. Harold Channon and Mr. Collinson, proceeding with their investigations on blood fat, have obtained results which bear on the method of transport of unsaturated acids from the liver to the tissues. Professor Passey's report contains also short accounts of research work undertaken with the aid of special grants. Professor F. Mellanby records cancer investigations continued at the University of Sheffield from 1929 to 1930. An examination has been made of the chemical change in cancerous tissue, and especially those changes which are known to differ from the corresponding ones in normal tissue. Attention has been directed also to the effect of diet and other factors on the initiation and growth of tumours in mice. It has been shown that the mechanism of the production of lactic acid in cancer tissues differs completely from that concerned in muscle. The development of tar tumours in mice has been proved to depend on the rate of access of this agent to the reacting skin cells by virtue of its solubility in the skin fat. Inhibition of the cancerous reaction was found to follow the application of petroleum ether to the skin before the tar applications.

The Marie Curie Hospital in London.

Although the Marie Curie Hospital at Swiss Cottage for the treatment by radium of women suffering from cancer and allied diseases has been receiving patients since last September, the formal opening took place on July 10th when Mr. Stanley Baldwin, M.P., supported by the French and Belgian Ambassadors, performed the ceremony. The hospital has been founded by the Cancer Research Committee of the London Association of the Medical Women's Federation, and is organized and staffed entirely by women. The work of which it is the outcome was started five or six years ago, after a number of the participating men had visited Continental clinics to study radium treatment. The support of the Medical Research Council and of the British Empire Cancer Campaign was enlisted and a supply of radium, which now amounts to one gram, was obtained. For a time the work was carried out from four hospitals—namely, the Royal Free, the Elizabeth Garrett Anderson, the South London Hospital for Women, and the New Sussex Hospital, Brighton—the radium being taken from one place to another as required. The need for the centralization of activity became evident, and a pleasant house, No. 2, Fitzjohn's Avenue, was acquired and adapted, becoming in a sense a special annexe to the four institutions named. At a private reception before the opening with Mrs. Pinsent, chairman of the Appeal Committee, a few terse, brief addresses on the work done and contemplated were given by Dr. Hurdon, the director, and Dr. Helen Chambers, the pathologist. It was stated that, although the results were extremely encouraging and confirmed those of Continental and other clinics regarding the value of radium in uterine disorders, the time was not ripe for any final report, since five years had not yet elapsed since the first cases were treated. Every patient was being followed up, and the ultimate results were recorded on uniform lines. Since the work was started in 1925 between 400 and 500 cases of uterine cancer had been treated by radium, of the operable cases 90 per cent. were free from all signs and symptoms of cancer, and the inoperable cases, with few exceptions, had greatly benefited. The cases treated were not limited to the malignant group, an increasingly important part of the work of the clinic was the treatment of non-malignant haemorrhagic conditions of the uterus, in which radium was now used in the majority of cases. The hospital at present contained thirty beds, including five private wards with two beds each and two with one bed. Plans were being prepared for a new wing with additional wards to bring the beds up to fifty, and for the provision of an x-ray department, a pathological laboratory, and more nurses' accommodation.

Mr. Stanley Baldwin, opening the hospital with a golden key presented by the architect (Miss Elizabeth Scott), paid a tribute to the radiological pioneers, some of whom, he said, had given their lives and many their health in establishing the technique of radiological application. Dr. Maud Mary Chaburn, chairman of the committee of management, and of the cancer research committee of the hospital, said that there was a certain reserve between the sexes which prevented many women from consulting medical men just on the chance that there might be something wrong. They waited until the condition became worse, and if the case was really one of cancer the result of such waiting was disastrous. It was hoped that this women's effort on behalf of women would lead to many cancer cases being treated earlier, thereby reducing the terrible mortality. The French Ambassador (M. Fleuriau) read a message from Madame Curie, in Paris, wishing success to the undertaking.

New General Hospital for Margate and District.

The new Margate and District General Hospital was opened by Prince and Princess Arthur of Connaught on July 3rd. The address of welcome presented to them stated that the Margate cottage hospital which had served the district admirably for thirty years had become inadequate from the point of view of accommodation possessing as it did only thirty beds. Lately increased to fifty by the construction of a temporary wooden annexe. Plans for a new general hospital were formulated and an appeal for funds was launched at a representative meeting of citizens in March 1926. Of the sum of £70 000 required £57 000 was secured before the opening mostly as a result of local effort. Prince Arthur in reply to the address congratulated the people of the town and neighbourhood upon their courage and foresight in embarking upon an ambitious scheme for the building of an entirely new hospital. From his own personal experience as chairman of the Middlesex Hospital he well knew the magnitude of the task, but, as all who worked for hospitals knew full well even when an ideal site had been secured, as in the instance, and

a really fine building constructed, the task was not finished, nor could ever be Those connected with hospitals had always to be up and doing to keep abreast of the amazing progress which was being made in science, research, and hospital organization He was delighted, though not in the least surprised, to be told of the loyal and devoted services of the staff of the Margate Hospital, both doctors and nurses He then proceeded to open the building with a golden key presented by the architects (Messrs Adams, Holden, and Pearson of London), and accompanied by the president of the hospital, Captain J I H Friend, and the medical superintendent, Dr W G Sutcliffe, made a tour of inspection The new hospital is planned symmetrically on a fine open site in St Peter's Road An endeavour has been made to preserve in the larger institution the homely and friendly atmosphere which has characterized for thirty years the work of the cottage hospital which it is replacing The south-west wing, on the ground floor, provides accommodation for 14 paying patients in rooms containing one, two, or three beds, and the south-west wing has 18 beds for medical cases On the first floor there are two large 18-bed wards for surgical cases, one for men and the other for women, and there is a children's ward with eight cots, opening on to a balcony facing east The wards are all arranged to overlook distant country, they are away from the road, and out of hearing of noisy traffic Special attention has been paid to the x-ray department, which has been planned so that eventually, when funds become available, they may house the modern transformer outfit and x-ray therapeutic installations which it is hoped to possess The out-patient department, the two maternity rooms with vita-glass windows, the sisters' and nurses' residential rooms, as well as the administration offices and service sections, are all designed in accordance with the most modern ideas of hospital construction Judging by the scenes on the opening day, Thanet is very proud of this new hospital, which is the outcome of local effort The very bricks with which it is faced have been made by Kentish hands

Correspondence.

SYME'S AMPUTATION

SIR,—On page 42 of the *Journal* of July 5th Mr A H Mosely of Sydney states "I quite agree about the Syme amputation, it has not been a success on the whole" In contrast with this view, however the operation as described by Professor Syme gave excellent results His account was published in *Syme's Observations in Clinical Surgery* dated 1861, a book which is now difficult to obtain On that account I have copied out the following description

"In performing the operation the foot being held at a right angle to the leg, the point of a common straight bistoury should be introduced immediately below the fibula at the centre of its malleolar projection, and then carried across the integuments of the sole in a straight line to the same level on the opposite side The operator having next placed the fingers of his left hand upon the heel, and inserted the point of his thumb into the incision pushes in the knife with its blade parallel to the bone, and cuts close to the osseous surface, at the same time pressing the flap backwards, until the tuberosity is fairly turned, when, joining the two extremities of the first incision by a transverse one across the instep, he opens the joint, and, carrying his knife downwards, on each side of the astragalus, divides the lateral ligaments, so as to complete the disarticulation Lastly, the knife is drawn round the extremities of the tibia and fibula, so as to expose them sufficiently for being grasped by the hand, and removed by the saw After the vessels have been tied, and before the edges of the wound have been stitched together, an opening should be made through the posterior part of the flap, where it is thinnest to afford a dependent drain for the matter, as there must always be too much blood retained in the cavity to permit of union by the first intention The dressing should be of the lightest description The advantages of this operation are in the first place, its facility and simplicity, requiring no tourniquet, and being completed, so far as the disarticulation is concerned without any hurry in less than a minute secondly, its not implicating any large blood vessels or nerves so as to expose the patient to the risk of suffering from haemorrhage or nervous pains, thirdly, its protection against the chance of exfoliation by the spongy nature of the bone divided, and, fourthly, its affording a stump so perfect as to give the requisite support without any extraneous assistance No other stump of the lower extremity can bear pressure on its face sufficiently for supporting the body but the one in question, or, at least, be so used without inconvenience, and there was a man, lately at the hospital, who, after having had both of his feet amputated, could not only stand, but walk, and run, without aid of any kind whatever"

As to the practical value of Syme's amputation, I find a reference to it in *Memorials of the Life of James Syme* (p 181), where Dr Hudson of New York makes the following comment

"No amputation of the inferior extremity can ever compare in its value to the subject with that of the ankle joint originated by Mr Syme One gentleman, for whom I applied a foot, has walked thirty five miles in a day on a hunting excursion, while his companions did not suspect that he was otherwise than whole"

—I am, etc,

July 8th CHARLES W CATHCART,
Consulting Surgeon, Royal Infirmary, Edinburgh.

INTRAVENOUS SCLEROSING SOLUTIONS

SIR,—In the *Journal* of July 12th (p 59) Dr T H T Barber mentions the successful use of sodium morrhuate in the treatment of varicose veins, and thinks it may supersede other sclerosing agents, Dr A S Ross also reports good results from injecting haemorrhoids with this preparation I may therefore be permitted to point out that I first prepared sodium morrhuate in 1918 in Calcutta for use in leprosy and tubercle, and I found that in strengths of over 3 per cent it caused a strictly localized mild inflammation of the vein wall, followed by firm fibrous occlusion of the vessel, just as did the intravenous injection of sodium hydnocarpate and sodium gynocardate do to an even greater degree, the intravenous use of which in leprosy I first reported in the *British Medical Journal* of October 21st, 1916 (p 550) None of these preparations increase the coagulability of the blood, so there appears to be no danger of embolism resulting, and very slight pain or discomfort follows their use, although if several cubic centimetres of the hydnocarpate solution is injected rapidly into a vein harmless ephemeral giddiness may result Five per cent solutions are probably best for producing sclerosing of blood vessels, and the drugs can be sterilized by heat or by adding 0 5 per cent carbolic acid Sodium gynocardate is made by Martindale and Co, and "alepol," now so largely used in leprosy, consists mainly of sodium hydnocarpate

Some years ago I suggested to a surgical colleague a trial of sodium hydnocarpate solutions by injection into hydroceles after tapping I also tried unsuccessfully to persuade a patient with a hopeless bulging thoracic aneurysm to allow sodium hydnocarpate to be injected into it, and I still think such a trial is indicated in otherwise hopeless cases to induce a deposit of firm fibrin on the inner wall of the dilated vessel —I am, etc,

London, N W 1, July 14th LEONARD ROGERS

SIR,—In the *Journal* of July 12th Dr T H T Barber mentions the use of sodium morrhuate in the injection treatment of varicose veins I have lately used this solution in a few cases, it appears to give less pain, and to be no less effective than quinine urethane, which I generally use

A few days ago I gave a patient 1 3 c cm sodium morrhuate, just after the dressing had been applied she complained of feeling faint, and became unconscious She was pallid, the pulse and heart beats were very faint, and the breathing was shallow Some six or seven minutes later she had slight general twitching, retched several times, and then began to come round Some strychnine and strophanthus were given hypodermically Two hours later she was fairly well, complaining only of slight headache She explained that just after the injection she felt pain in the head, throbbing in the ears, definite pain under the left breast, and a "curious numbness" She has, on previous occasions, had quinine urethane injections in the other leg without any untoward happening

The sclerosing effect of the sodium morrhuate injection was most satisfactory, it was injected into a large vein

at the ankle, and the vein was thrombosed to the level of the head of the fibula But one feels inclined to doubt the safety of the drug after the above experience—I am, etc,

St Anne-on-the-Sea July 12th A H WINCHESTER, F R C S Ed

THE TECHNIQUE OF INJECTING VARICOSE VEINS

SIR,—Dr Noel Scott's article on the treatment of varicose veins by injection in the *Journal* of July 12th (p 58) will be read with much interest by practitioners who have already had some experience in the chemical sclerosis of varicose veins His use of a lithium solution for veins, and his method of injecting ulcers with the quinine solution are genuine advances in our knowledge of the subject

But I am not in agreement with Dr Scott's description of the actual technique of injection, and I cannot understand his statement that veins are more easily injected when they are collapsed Surely this is not so The more distended a vein is the more easily can it be entered with a needle He is right when he states that the ideal position for the patient is prone upon a couch and I submit that such a position is practicable in every case provided that a suitable tourniquet is used Dr Scott states however, that a tourniquet produces venous engorgement is difficult to manage single-handed and causes considerable pain to the patient Each of these statements is wrong The tourniquet need cause no harmful engorgement its function is to maintain such a column of blood in the vein when the leg is elevated as is present when the patient is standing The tourniquet which I employ is not difficult to use single handed and its application is quite painless It was made for me by Messrs Woollen of Manchester and consists of a rubber bag rather larger than that used in a sphygmomanometer, and enclosed in a linen washable sheath A stout webbing strap is slotted into the sheath and fastens with a buckle A length of rubber tubing and a bulb, fitted with a release valve, provide the means of inflation

The patient stands on the affected limb, the tourniquet is lightly strapped in position, which, if the lower part of the leg is being treated is just above the knee The bag is inflated just sufficiently to maintain the distension present in the erect position and the patient lies down His foot is elevated on a cushion or low stool The needle is then inserted, and if one has a syringe with a slightly fitting plunger it will be unnecessary to withdraw the latter to ascertain when the vein has been entered Owing to the intravenous pressure blood will flow into the syringe immediately the needle is in the lumen of the vein The valve of the tourniquet is released, the vein rapidly empties, and the injection is made slowly

There is no need to massage the solution along the vein, as suggested by some writers gravity carries it upwards After the injection has been completed a few moments will suffice for the sclerosing solution to have passed beyond the site of injection when the needle can be withdrawn and the puncture sealed with collodion The patient remains in the prone position for a minute, when he can be allowed to get up

The advantages of this method are that from the moment the needle is inserted until the patient steps off the couch the leg is absolutely immobile there is no leakage of blood when the needle is withdrawn, and, with reasonable care, no case of complete penetration of the vein need occur—I am, etc,

Buxton July 12th ALFRED R ROOKE

HORSESHOE KIDNEY

SIR,—I have read with interest the recent report by Mr Arthur Jacobs (July 5th, p 8) and the letter of Mr W Clifford Morson (July 12th, p 80) In excretion urography we now have a method which makes for greater precision in the diagnosis of this condition Unless the renal function is greatly impaired we are able to get by an intravenous injection of uroselectan a clear picture of the size, shape, and disposition of the renal substance as well as the actual drainage system A horseshoe-shaped kidney is readily outlined in the radiogram (other abnormalities in size and shape may be clearly shown) The method will also show whether the junctional band consists of true renal substance or merely fibrous tissue

In April last a young girl was admitted to the infirmary here with vague abdominal symptoms and swelling which, on examination, was thought to be a horseshoe kidney Intravenous pyelography proved this supposition to be correct, and at the same time showed that the junctional band consisted of actual renal tissue Recently the same procedure was utilized in demonstrating the shape and size of a "cake-like" kidney which was lying partly in the right iliac fossa and partly in the pelvis It had become infected, and the clinical picture closely simulated an appendix abscess More details of these (and other) cases will I hope, be published shortly in an article on excretion urography—I am, etc,

Surgical Unit Cardiff June 14th ROBERT V COOKE.

AORTIC ANEURYSM SIMULATING PULMONARY DISEASE

SIR,—Dr R B Myles's letter on July 12th (p 79) on the interesting case of aortic aneurysm which simulated bronchitis, indicating the value of a radiogram in the diagnosis, and the two previous cases of the simulation of asthma reported in the *Journal* by Drs Cock and Hill, tempt me, while this subject is fresh in the minds of your readers, to refer to three cases—which I hope to report fully at a later date These were cases of syphilitic aortitis (two with aneurysmal dilatation) with histories of cough, blood-stained expectoration loss of weight evening temperature, and sweats—symptoms due mainly to secondary pulmonary congestion—which had been sent to me at my tuberculosis clinic as suspicious cases of phthisis I referred to these cases in a paper I read on the problems of differential diagnosis before the Tuberculosis Association

I think it will be generally admitted that the importance of careful routine clinical and radiological examination in suspicious chest cases—not excluding the importance of a full history and examination of available sputum—cannot be too strongly emphasized Not infrequently the history and clinical examination alone have proved in the hands of most chest clinicians to be deceptive, and it would be foolish to deny this As has been frequently stated clinical and radiological examinations of the chest are complementary and not competitive methods of examination Just as in every case percussion and auscultation are routine methods of examination of the chest so routine radioscopy should be practised Only in this way will accurate early diagnosis be obtained and, in my opinion, such cases as have been reported will prove to be less rare than is generally supposed It is of interest to note that at a recent discussion at the Royal Society of Medicine on syphilitic aortitis both Professor Lesché of Berlin and Dr John Parkinson emphasized how rapidly routine x-ray examination was taking the premier place in early diagnosis—I am, etc,

London S W 1, July 12th PHILIP ELLMAN

OCCIPITO-POSTERIOR POSITIONS

SIR,—It may be of interest that occipito-posterior positions seem to be unknown among races that habitually squat for urination and defaecation (no doubt they occur in the richer people who have adopted English habits as regards chairs and the closet) It is obvious that the child's back must come forward when the mother adopts the squatting position I suggest this as treatment (or course before the head has entered the brim)

For years I have asked expectant mothers to use a chamber rather than the closet for the daily evacuation, as I found they then needed no aperient It cured constipation, stretched their sacro-iliac joints, and strengthened the perineum—I am, etc,

London, W.1, July 13th. KATHLEEN VAUGHAN

PROGNOSIS IN UTERINE CANCER

SIR,—I desire to call attention to an article by Dr W P Healy to which reference is made in the *Epitome* of July 5th (para 20) Writing in the *New York State Journal of Medicine* of February 15th, under the title "Factors that influence prognosis and end-results in uterine cancer," this author states that Broders of the Mayo Clinic groups uterine cancers according to their different cell types in four grades, and compares the results of surgical and of radiation treatment according to the grade of tumour In Grade I he places those tumours "which represent the adult highly differentiated type of epidermoid cancer cell," and in Grade IV those tumours "which are very cellular and made up of completely undifferentiated embryonal or anaplastic cells" Grades II and III are intermediate between Grades I and IV in degree of cellular differentiation and evidences of anaplasia Dr Healy points out that the malignancy of the tumour varies with the stage of development of the cell, the higher the stage of development the less is the malignancy, and the lower the type of cell development the higher is the malignancy

These observations are, I think, generally admitted to be true, but his further observations will probably come as a surprise to a great number of medical practitioners—namely, "that the degree of radio-sensitivity of the epidermoid cancers of the cervix varies directly with the cell type, Grade I being the most radio-resistant and Grade IV the most radio-sensitive," an observation which has a most important bearing upon the question of treatment, which is borne out by the statistics and end-results which he quotes In cancer of the cervix in Grade IV, the most malignant type, when treated surgically by hysterectomy, only 9 5 per cent of the patients remained well after five years, whereas of those treated by radiation 66 per cent remained well after five years Cancer of the corpus uteri he also differentiates into four grades, according to cell type and structure He states that those in Grade I were least malignant and were the most readily cured by any form of efficient therapy, Grade IV cases were the most malignant, and at the same time the most radio-sensitive, histologically resembling closely the anaplastic Grade IV of cervix cancers These cases of cancer of the corpus under surgical treatment gave uniformly bad results, not one of the patients in Mahle's report from the Mayo Clinic having survived five years, whereas under radiotherapy 50 per cent of the patients with Grade IV corpus cancer were alive and well at the end of five years In advanced cases of all grades which were treated by radiotherapy 23 per cent of the patients were still alive at the end of five years, though all these cases were hopeless from a surgical point of view when first seen

It is remarkable in view of these statistics how few cases of uterine cancer are treated by radiation in this country, when compared with the enormous number treated surgically, the only reason is apparently that the beneficial effects of radiotherapy have not been made sufficiently evident in the medical literature of this country I have treated a large number of cases of uterine cancer by means of radiation with success, but I must admit that I had no idea that the comparison between surgery and radiotherapy was so heavily in favour of the latter —I am, etc,

London, W 1, July 5th CHRISTOPHER KEMPSTER

X-RAY TREATMENT OF TONSILS

SIR,—In reply to Dr Webster's letter (June 28th, p 1197) regarding the enucleation of tonsils by diathermy, I certainly had no wish to make disparaging remarks about *x*-radiation in general Surely, however, such appreciation of *x*-ray treatment may be accompanied by an acknowledgment of its limitations My statement in "Destruction of tonsils by diathermy" (*British Medical Journal*, June 14th) reads

"*x* rays and radium cause the tonsils and lymphoid tissue to diminish in size, but the remaining sunken fibrous tonsil may continue to serve as a focus of infection"

Further it was suggested that haemolytic streptococci and other pathogenic organisms are often found afterwards unaffected by such treatment Thirdly, there was the possibility of *x*-ray dermatitis and damage to the thyroid-parathyroid apparatus Dr Webster tells us that he is prepared to repeat a 50 per cent erythema dose twice weekly, as this cannot possibly lead to dermatitis My own experience of twelve years' *x*-ray therapy does not agree, as I have seen *x*-ray dermatitis develop with still smaller dosage Dr Webster possibly ignores the effect of secondary *x*-radiation when he states that by his technique *x* rays cannot possibly reach the thyroid and parathyroid structures

With regard to the second and pathological question, it is quite correct that haemolytic streptococci are occasionally located in apparently healthy throats So are diphtheria bacilli, but surely it is at least desirable to eliminate them, especially when virulent specimens are detected I am assured by my pathologist friend Dr Creed that the suggestion that the tonsils are part of a normal antibody laboratory is sketchy in the extreme, since no authority has ever discovered where antibodies are formed normally The spleen probably plays a great part It is still more unlikely that organisms in freely draining tonsillar crypts act as a stimulation of antibody production Further, even if, as Dr Webster states, *x* rays cause a reduction in the number of organisms in the tonsil crypts, surely this would by his very theory reduce the antibody stimulators

In my opinion the greatest objection to the *x*-ray treatment of tonsils lies in the very shrinkage Dr Webster mentions The extensive invagination of surface area produces innumerable pockets or crypts As a result of the diathermy enucleation, however, we are left with a soft glassy scar with practically no contraction of tissue —I am, etc,

Putney Hill, S W 15, July 7th. WARNER COLLINS

VILLAGE SETTLEMENTS IN THE AFTER-CARE OF TUBERCULOSIS

SIR,—In the review of the report of the employment committee of the Joint Tuberculosis Council (*Journal*, June 28th, p 1183) I notice the following passage "An important criticism of village settlements is that they cater for so few people" I hope you will forgive me for writing to point out what a curious criticism this is The only reason why village settlements have so far only catered for a few people is because no such settlement has yet had enough capital As the committee indicates, the local authorities originally responsible for the inhabitants of a village settlement contribute nothing towards the capital expenses involved If they did—and I have already suggested a manner in which they might conveniently be empowered to do so—it would be found that many more people would be "catered for" in village settlements

The committee's suggestion that persons "settled" should be "unsettled" after a few years seems to me to show a complete misunderstanding of the foundation of village settlements They are not intended to "harden off" early cases, but to provide permanently for moderately advanced cases which have been rendered quiescent Surely the committee is aware that in such cases quiescence is not a permanent condition, and that exacerbation would follow a return to the outside world, especially as the prospects of obtaining suitable employment are, on the committee's own showing, practically nil?

One further point the result of the appeal to employers was the conclusion that "ordinary industry can contribute nothing of importance to a solution of the problem at issue" Yet the committee, later in the same report, "expresses the view that the primary aim of all schemes for care and after-care should be to increase the proportion of cases that can enter ordinary industry!" Comment is superfluous

The committee's report proves, more clearly than it proves anything else (1) that ordinary industry will not absorb ex-sanatorium patients, and (2) that only in village settlements can such persons be sure of permanent employment Is it not evident, therefore, that until there are enough village settlements the whole problem of tubercu-

le is will remain unsolved? "Early" cases avoid discovery because they fear economic disaster Remove that fear by means of village settlements and surely the proportion of 'early' notifications will increase One thing is certain until that fear is removed we shall make little progress in combating tuberculosis—I am etc,

P C VARRIER JONES,
July 6th. Medical Director Papworth Village Settlement

AN IMPERIAL MEDICO POLITICAL CONFERENCE

SIR,—It is now common knowledge that the British Medical Association will be celebrating in 1932 the centenary of its birth For the past twenty-eight years there have been held annually in the United Kingdom meetings of representatives, but the problems discussed have been almost entirely confined to those affecting the medico-political interests of the member resident there Although representatives from overseas do to some extent attend, this annual opportunity for a short medico political conference among themselves and with those working at the headquarters of the Association has never been taken advantage of

It has become now quite the usual thing for the British Government of the day to call into conference representatives of the Dominions and of the Colonies when there are discussed questions that profoundly affect the future of the Empire and other nations, many of which have a medico-political bearing At Geneva the League of Nations has developed a section that deals with social services, and consequently impinges on and eventually controls, matters in which members of the British medical profession are deeply interested Wireless, air mails, and rapid means of transit have brought all much closer together, disease is less localized now than it used to be Medico-political activities can no longer be conducted in isolation

Does not the centenary in 1932 provide a similar opportunity for more closely linking up the Association at home and the Association overseas, for purposes of education, consultation, and protection, thus allowing it to take in Imperial health questions generally that intimate consultative and co-operative part which it takes locally in all parts of the Empire? We have a Dominion Committee, and it does good work But in 1900 a medico-political committee for Great Britain was sufficient for all purposes, how it is only a small part of the intricate machinery developed Health insurance problems, State and voluntary hospital problems, maternity service problems, general medical service problems, drug traffic problems—all have their peculiar setting in relation to the part of the Empire concerned On all these and other matters exchange of experience would be invaluable

The human tendency is for those with a common interest to come together, and thus we are faced with innumerable kaleidoscopic groupings This is all to the good in so far as central bargaining is concerned But if those who have to face and to deal with such trained and experienced combinations are themselves at the best only individual units, then their defeat becomes as easy as that of an undisciplined mob We at home should recognize the advantage of personal contact with the stimulating influence of colleagues who live under freer conditions We are still far too provincial and introspective in our outlook, our interests, and our actions Such a conference—especially if repeated at reasonable intervals—would help to alter all this and result in good to those we who live here desire to help

The Sections at the Annual Meeting in 1932 could be made to acquire a more Imperial aspect by a suitable choice of subjects for papers and debate But unless the individuality and freedom of medicine has been secured all discussion of scientific subjects will be academic and conducted in shackles

There is time for our overseas members to consider the proposal and to express their views—I am, etc

Hove, Sussex, July 10th. E ROWLAND FOTHERGILL

Medical Notes in Parliament

[FROM OUR PARLIAMENTARY CORRESPONDENT]

THE House of Lords has this week decided to insist on its amendment to the Coal Mines Bill which would permit the working of a ninety hour fortnight in mines. The House of Commons debated the Scottish Estimates Imperial Trade Policy, and a motion to authorize an increase of £10,000,000 in the Unemployment Insurance Fund The Finance Bill was again considered on report The Housing (Scotland) Bill passed through report and was read a third time in the House of Commons In the House of Lords the Housing (No. 2) Bill was read a second time

The Mental Treatment Act (1930) received the Royal Assent on July 10th

In the House of Commons on July 15th discussion arose on the position of opticians under the national health insurance scheme and a statement was made by Mr Greenwood

Mr Greenwood states that an interim report from the Committee on Maternal Mortality will be published before the end of the month

Scottish Department of Health

The House of Commons on July 14th considered in committee a vote *to complete the sum required for the salaries and expenses of the Department of Health for Scotland*

Mr W ADDISON in moving the vote said that in 1929 the birth rate in Scotland was 19·02 per 1,000 of the population Both the birth rate and the actual number of births were lower last year than in any year since compulsory registration was introduced in 1855 The death rate was 14·5 per 1,000 which was slightly higher than in 1928 This was largely if not altogether attributable to the epidemic of influenza in the first quarter of 1929 Respiratory diseases during that epidemic had an adverse effect on the infantile mortality rate which was 88·8 per 1,000 in 1929 This was however lower than the rate for any year except 1923 and 1928

Maternal Mortality in Scotland

Scotland was still in an unenviable position with regard to maternal mortality the rate for 1929 being 6·9 per 1,000 persons compared with 7 for the preceding year The rate had varied very little since the introduction of schemes of maternity and child welfare and showed no marked tendency to decline The matter was continually occupying the attention of the Department of Health the local authorities and others engaged in medical administration Investigations were now being made in Scotland into the deaths of married women during pregnancy or within four weeks of the termination of pregnancy While the numbers so far investigated were not sufficient on which to base definite conclusions there was throughout a quite definite indication of the need of providing more complete medical supervision and care of women during pregnancy To that end it was hoped with the present organization of the health service under the Act of 1929 that an effort would be made to secure an adequate ante natal service but for the best results they must look to the mothers themselves to co-operate by making a fuller use of the services provided This would probably have to be done by stimulating their interest in these services and educating them as to their value

Tuberculosis

With regard to tuberculosis the picture was more encouraging The death rate in 1929 from all forms of tuberculosis was 0·9 per 1,000 the lowest yet recorded in Scotland. It was 3 per 1,000 lower than the rate in 1923 which up to that time had been the lowest recorded figure In 1929 4,579 persons died from tuberculosis compared with 6,326 in 1919 Although respiratory tuberculosis shared in the high mortality of the first quarter of last year the death rate for the year was down and but for the abnormal weather in the first quarter the decrease in the number of deaths would have been even more substantial. Although tuberculosis still accounted for many deaths it was hoped that the continuance of the intensive campaign against the disease aided by improved methods of diagnosis and a greater facility for institutional treatment would ere long secure that tuberculosis would be classed among the less deadly ailments of humanity

Sickness among the Insured

The amount expended by the approved societies on sickness and disablement benefit still kept abnormally high In 1929 £1,924,000 was spent—an increase of £200,000 over 1928 The epidemic of influenza in the early part of the year accounted for some part of the increased expenditure but after making allowance for that and for the slightly increased number of insured persons at risk there remained a considerable part of the increase for which no explanation was available The Department continued to give the matter its closest attention and had been in conference regarding it with representatives of the approved societies and a

special committee of the Insurance Acts Committee of the British Medical Association The Department, in addition, had constantly before it the importance of determining, if possible, the causes from which the demand on sickness funds arose One difficulty was that it had not been possible hitherto to prepare and publish accurate statistical information regarding the nature and extent of incapacitating illnesses among the insured population The Department of Health was now in a position to remedy this defect On July 1st it put into operation a scheme for the collection of complete and trustworthy data from the approved societies, from which might be compiled statistical records giving, *inter alia*, the incidence of the various incapacitating diseases and their duration, not only for insured persons generally, but for other groups of insured persons, arranged according to area of residence, occupation, age, etc , also the extent to which individual medical practitioners were granting certificates of incapacity for work The scheme was considered recently at a conference between the Department and representatives of the larger approved societies in Scotland Those representatives approved the principle of the scheme, and promised to co-operate in making it as complete a success as possible Incidentally it was hoped that the more definite statistics, when published, would be of great value to the local authorities in their administration of the health services in their areas

With regard to the inhabitants of St Kilda, it had been decided to evacuate them, and the question of their destination was receiving attention Considerable improvement continued to be effected in the purity of the milk supply of Scotland That was in large measure due to the efforts of producers to attain a higher standard and to the increased attention given by local authorities to the inspection of dairy cattle and the structural and sanitary condition of dairy farms The Lanarkshire milk investigation, undertaken in the early part of the year, to ascertain the effect on the growth, height, and weight of school children by supplying them with an extra ration of milk, showed there was every sign that there had been an improvement in the children who received the milk, as compared with those who had not received it The Empire Marketing Board had promised a grant for an investigation into the incidence of tuberculosis in milk, to be continued for a period of two years, and to be carried out by the Department of Health in co-operation with the health authorities of Aberdeen, Dundee, Edinburgh, and Glasgow

With regard to housing, according to the latest returns there had been completed, at May 31st last, under all forms of State assistance in Scotland, 110,136 houses These probably accommodated about 495,000 people or perhaps one ninth of the working-class population in Scotland But at least another 100,000 houses were required before housing conditions could be regarded as reasonably satisfactory The Government were carrying through special legislation dealing with slum clearance, and when the new bill became law he trusted there would be a great forward movement by the local authorities

Debate

SIR J GILMOUR expressed the hope that the steps being taken by local authorities to set up abattoirs would lead to greater facilities for meat inspection, and that thus gradually the scourge of tuberculosis among cattle would be eliminated The problem carried with it the difficulty of obtaining the good will and co-operation of those in the industry, and it should be treated as a matter of education and administration The more people that could be induced to visit the research stations the better

MR MACPHERSON, speaking on the Highlands and Islands Medical Service, said that if this Government had done nothing else, it had done one good thing in promising to increase the annual grant to £72,000 It was a variable grant, and so long as the Government was in office it was more or less pledged to keep the grant at a figure high enough to meet the various needs of the community He knew the life of the Highland doctor in the old days very well indeed If ever there was a hero in the world it was the Highland doctor On many a stormy night in winter he would have to go miles up hill and down dale and very often, at the end of it, the journey would have cost him six or seven hours and he would probably get half a crown, or nothing at all, for going there It was a great joy to those interested in the Highlands to find that men of that calibre and quality could now be guaranteed in any case, a livelihood The grant introduced in 1911, had justified itself He impressed on the Under Secretary for Health the need of developing things, such as telephones in doctors' houses the housing of doctors, and of assisting nursing associations He drew particular attention to the nursing associations, which had been formed through the willingness of the voluntary workers and the local inhabitants to help themselves gradually to acquire nurses in the different districts As he understood it the voluntary associations did not desire to be dependent on State grants entirely They wished that in necessitous areas, the State should stand by and, where the need was greatest, come forward and assist in this very deserving work

DR ELLIOT said that the public health of Scotland seemed to be improving The attack on tuberculosis continued to give an increasing yield It took forty years to halve the death rate from tuberculosis after 1870 Afterwards it was halved again in twenty years Let them see if they could not halve it a third time in ten years Many water borne diseases had practically been conquered, food diseases were in the way of being conquered, but air borne diseases were still completely unsubdued Figures pointed strongly to the fact that the fundamental resistance of the individual to disease had not been safeguarded where it would give the best results When it was not safeguarded it would lead to breakdown in adolescence or adult life All efforts at administration were of no use unless they met with a corresponding good will among the people, such as a willingness to purchase and pay for clean milk The milk experiments in Lanarkshire, and other such experiments, would foster a health consciousness among the people Until they had got sound children between the ages of 1 and 5 years the children of 14 and 15 must take a secondary place Since we had turned so largely towards preserved foods, extract foods, and refined foods of one kind and another, the necessity for studying these things scientifically stood out in almost every section of the report Since 1920 the Poor Law authorities in Scotland had spent £10,000,000 on the purchase of food without, so far as he knew any real examination into the principles which governed dietetics in the modern State The difficulties before them were very great but there was no reason to suppose that a scientific examination into the feeding, both of the younger and of the older people would not give most valuable results The physical condition of our people was one of the chief concerns of the Department of Health

MR JOHNSTON, replying to the debate, referred to his recent visit to St Kilda He said that the condition under which the people there were living was almost incredible It was famine, There was an actual shortage of food, and, but for the devoted service and labour of the Queen's nurse, Heaven knew what tragedies would have occurred The Lanarkshire milk experiment with 10,000 school children would be of interest not only to Scotland, but to the world It would possibly do more to assist agriculture than any step which had been taken for a long time if it could be proved beyond all doubt that a ration of milk to the school child would raise its weight, and even its height, and would better its health in every way By organizing the milk supply through the local authority they would, later on, save untold millions of public expenditure The Secretary of State proposed, at an early date, when the public assistance committees had got on their feet, to have a discussion with some of them to see how far they could secure the adoption of a more reasonable scale, at least so far as the children were concerned

The vote was agreed to

Road Traffic Bill

The Road Traffic Bill was considered by the House of Commons on report on July 10th Clause 15 deals with the punishment of persons driving motor vehicles when under influence of drink or drugs DR VERNON DAVIES urged that the drugs should be specified He asked whether a man would be liable to prosecution under this clause if he took a heavy dose of quinine and deafness resulted The inquiry was not answered, but the clause was altered by substituting "or a drug" in place of 'or drugs'

SIR WILLIAM BRASS moved to provide that a person arrested under this section should be entitled to be examined by his own or an independent medical man

SIR WILLIAM JOWETT said the ordinary practice was that if a person charged with an offence of drunkenness wished an examination to be made by a medical expert of his selection that opportunity was given him The Government would see that the police authorities were properly circularized and reminded of this practice, and it would be pointed out to them that the Government thought it desirable that the practice should be continued

Sir William Brass withdrew his amendment

On Clause 35—obligation of owners of motor vehicles to hold insurance policies or other security against third party risks—MAJOR HILLS moved to omit Subsection 2 This proposes to confer a right on hospitals to receive a payment of £25 each for treating persons injured in certain cases by motor vehicles He agreed that the burden of treating motor accidents was breaking down the hospitals, but said it should be met by the imposition of an extra penny on each motorist's licence

MR HERBERT MORRISON said he proposed to leave this to a free vote of the House Personally, he took the view that the scramble of the voluntary hospitals for voluntary contributions was a degrading business The subsection bristled with difficulties, and he would vote against it

DR MORRIS-JONES said the House would be disappointed with the Minister's speech

DR MORGAN said the voluntary system of conducting hospitals was out of date and the great majority of the hospitals were nearly bankrupt The financial support which the bill would bring them was slight

After further discussion Major HILLS withdrew his amendment and the subsection remains part of the bill, discussion of which was adjourned

Preservatives in Cream.—Mr GREENWOOD told Mr Richard Tassell on July 10th that he had carefully considered representations made to him by those engaged in the production and distribution of cream as to the effect of the Order prohibiting the use of preservatives in cream upon the industry but was not prepared to suspend or modify them. A large number of efficient firms had adapted themselves to the new regulations and it was possible for others to do so.

Spectacles for Insured Persons.—Mr GREENWOOD told Mr Middleton on July 10th that the fixing of a scale of charges for the supply of optical appliances to insured persons was a matter for agreement and negotiation between approved societies and opticians. Negotiations had been in progress between the Joint Council of Qualified Opticians and representatives of societies and a scale of charges had been agreed upon. The societies were alive to the importance of protecting their members against unreasonable charges on the part of opticians and under the regulations governing administration of benefit they had full power to do so.

Inspection of Factories.—Mr SHORT replying to Mr Gould on July 14th said that the standard of inspection now aimed at under the Factory and Work hops Act was that recommended by the recent departmental committee on the factory inspectorate. It recommended further that works coming under certain codes of regulations should be visited every quarter. This standard could not be secured with the present staff but it should be possible to conform to it when the large increase recently sanctioned by the Government had been recruited.

Blind Persons.—Mr GREENWOOD told Sir N Grattan Doyle on July 14th that complete figures were not available of the total cost of administering the Blind Persons Act 1920 up to March 31st last. The total number of registered blind persons in England and Wales was 52,727 on March 31st 1929. On the same date there were 258 blind persons up to the age of 5 in England and Wales 2,439 from 5 to 16 1,623 from 16 to 21 3,285 from 21 to 30 4,716 from 30 to 40 and 5,897 from 40 to 50 and 20,149 between the ages of 50 and 70.

Universities and Colleges

UNIVERSITY OF LONDON

UNIVERSITY COLLEGE

The following awards have been made in the Faculty of Medical Sciences:

Entrance Scholarship H A Oatley Baylis Starling Memorial Scholarship R A Kekwick Sharpey Scholarship (physiology) J G Young.

Anatomy and Embryology Senior Class (prize equivalent to gold medal) G Qvist Junior Class (silver medal) J H Hellgren Junior Class (histology and embryology—prize equivalent to silver medal) K C Eden.

Physiology Senior Class (gold medal) A de Souza Junior Class (prize equivalent to silver medal) K C Ilen.

Organic and Applied Chemistry General Course (prize equivalent to silver medal) A G Hounslow.

Pharmacology Prize equivalent to silver medal G Qvist.

LONDON SCHOOL OF HYGIENE AND TROPICAL MEDICINE

The following candidates have been approved at the examination indicated:

ACADEMIC DIPLOMA IN BACTERIOLOGY.—Y B Abdoosh H R Aggarwal L G Anderson J G C Campbell J Carmichael F P Coyne S R Pandit R S Twigg.

Diploma in Tropical Medicine and Hygiene

The following have successfully passed the school examination at the termination of the eighty-eighth term (February-July):

A B Cook (Duncan medal) T F Anderson W K Connell D R McPherson L N O'Neill C F Roberts R G Spink D E Stewart M V N Sudds H G Timbres C A Alvarado F Burton G Q Chance I J Cowin R I Dutt M A Gaffar D R Griffith L R Khan A H H Pirdordi I M Lourie F H Mackay F Marsh L C W Maxwell D Murray T H Nolan P K Rao R Shelley H M Soar T W Stephens B A Taylor W F O Taylor S F Theis G M Tollidge H B C Wallace E M Wijerama W B Willis E D B Wolfe K. Wood-Martin.

Passed with distinction.

UNIVERSITY OF LIVERPOOL

A DEGREE ceremony took place in St George's Hall on July 5th. The following medical degrees were conferred:

M D.—W E A Burton R L Corbett Gwyneth Griffith Muriel B Hall A J Hare F W Jones Edna J Manson.

M B, Ch B.—[1] G W Causer; [2] Marjorie E Birch; [2] Honora J Twomey.

The following have been approved at the examinations indicated:

M B, Ch B.—*Part III (1923 Regulations)*: A I Beresford I Rossen F B Williams. *Part I*: M L Kaufman. *Part II*: R Fairhurst, R K Iyer. *Part II (1924 Regulations)*: L G Anderson A Blumfield W N Chalmers J W Cheetham D H Collins A Curtis W Dodd P I Fox M Glynn Morris D O Hughes V S Hughes-Davies A T Jones R P Kemp F R Kitchin J L Newton J Polonsky W J Poole M Solomon T P Twomey R Wright. *Part I*: F J Burke H T Cank, [3] W J Chisnall L M Crook, [2][3] W S Diggle H G Evans, [2] L Harris, J H Hughes, [2] T L Hughes F P Jammy J A Jones, O V Jones, [3] W W Pavah and [3] T P Lennon. H P Loewenthal, [4] A J Martinez, [3] D F Morgan I B Moroney, [3] L Potter, [3] J Rayner I H Thorpe J N Tollington, Winifred Wall, A R Williams & Wynroe. Passed in separate subjects: F C Bell (pharmacology and toxicology), A Ingham (forensic medicine and toxicology) and Mary F Lacey (pharmacology and general therapeutics).

D P H.—*Part I*: A Ashworth Elizabeth M Hardcastle I. Krishna.

DIPLOMA IN TROPICAL MEDICINE.—F C McKenzie.

DIPLOMA IN TROPICAL HYGIENE.—G R Carter T T M Chen J H Dobbin R A Heatley G B McHutchison E S E Menon C K Row T Wilson.

[1] First-class honours.
[2] Second-class honours.
[3] Distinction in surgery.
[4] Distinction in obstetrics and gynaecology.
[5] Distinction in forensic medicine and toxicology.
[6] Distinction in public health.
[7] Distinction in pharmacology and general therapeutics.

The following awards have been approved by the Senate:

Ethel Boyce Fellowship in Gynaecology Dr T N A Jeffcoate. John W Garrett International Fellowship in Bacteriology Dr R Fraser. John Rankin Fellowships in Anatomy (for one year) Dr J A Martinez and Dr N W Robert. Robert Gee Fellowship in Human Anatomy Dr M J Bennett-Jones. Holt Fellowship in Pathology Dr J Lattman. Holt Fellowship in Physiology Dr R Bourne. John Tomlinson Memorial Fellowship in Biochemistry Dr R W Brockfield. Thelwall Thomas Fellowship in Surgical Pathology Dr L Findlay. University Graduate Scholarship W S Dingle. Samuel Memorial Scholarship in Medicine) Dr F W Jones. Samuels Memorial Scholarship (in surgery) Dr J C Lloyd. Samuel Memorial Scholarship (in Obstetrics and Gynaecology) Dr M M Datnow. John Rankin Exhibition: Practical Anatomy divided between Freda B Bannister and C H Stewart-Hess. Margaret Pierce Smith Scholarship renewal for a fourth year) A S Kerr. Carter Scholarship Exhibition G W Causey. Derby Exhibition G W Causey. *proxime accessit* Marjorie E Birch.

UNIVERSITY OF SHEFFIELD

Dr JOHN RENNIE D P H medical officer of health for the city of Sheffield has been appointed Professor of Public Health in place of the late Professor F E Wynne.

The following candidates have been approved at the examination indicated:

FINAL M B, Ch B.—K G A. Barlow M B Hallam F Hudson Constance N Jenkinson W H B Moore Ethel H. Waddy.

UNIVERSITY OF ST ANDREWS

THE Senatus of St Andrews University proposes to confer the honorary degree of LL D on Emeritus Professor J A Lyttle in October. He was vice president of the Obstetrical Section of the British Medical Association meetings in 1910 and 1914.

NATIONAL UNIVERSITY OF IRELAND

UNIVERSITY COLLEGE DUBLIN

THE following candidates have been approved at the examinations indicated:

M D.—C Bastible T O'Connor H Quinlan.

FINAL M B, B Ch, B A O.—T C J O'Connell M J Mullen Patricia M J Daly P J Sianot [1] J P Ferguson M I Cotter M F Daly J J Godson C A Macken P J McManus, A P Madigan P J Murphy J C O'Brien.

D P H.—*Part I*: Bridget Crawford, J C Liddy. *Part II*: [2] C Bastible M Kirby Mary F Moloney J H O'Neill.

[1] *First-class honours.* [2] *Second-class honours.*

ROYAL COLLEGE OF SURGEONS OF ENGLAND

A QUARTERLY Council meeting was held on July 10th when the President Lord Moynihan was in the chair.

Election to Council

The President stated that at the recent election of three Fellows into the Council in the vacancies occasioned by the retirement in rotation of Mr R P Rowlands Sir Percy Sargent and Mr Victor Bonney the three retiring members were re-elected.

Sir Percy Sargent Mr Victor Bonney and Mr R P Rowlands were introduced and took their seats in the Council.

The late Sir Anthony Bowlby

Mr L B Rawling accompanied by Lady Bowlby and Sir Anthony H N Bowlby and Miss Bowlby presented on behalf of the medical staff of St Bartholomew's Hospital a coloured portrait by Dorofield Hardy of Sir William Llewellyn's portrait of the late Sir Anthony Bowlby. The Council accepted the portrait with appreciative thanks. The President also stated that a silver tablet in memory of the late Sir Anthony Bowlby presented by some American surgeons who had been associated with him during the war was unveiled in the position assigned it in the Inner Hall.

Diplomas

Diplomas of Membership were granted to two candidates and the diploma of Fellowship was granted to Mr Donald Spiers Montague Barlow these candidates having complied with the by-laws of the College.

Licences in Dental Surgery were granted to 33 candidates.

Diplomas were granted jointly with the Royal College of Physicians in Psychological Medicine to 10 candidates. In Laryngology and Otology to 17 candidates.

Fellowship Examination

A report was read from the Board of Examiners in Anatomy and Physiology for the Fellowship stating that at the examination concluded on June 14th 128 candidates were examined of whom 54 were approved and 104 rejected. The report from the Board also announced the award of the Hallett Prize for the examination concluded on June 14th to George Qvist of University College Hospital Medical School.

Primary Fellowship Examination in Canada

The Council appointed the following Assessors, nominated by the Canadian Medical Association for the primary examination for the Fellowship to be held at Montreal on September 2nd, 3rd, and 5th next: Assessor for Anatomy, Professor S. E. Whitnall (McGill University, Montreal); Assessor for Physiology, Professor John Fait (McGill University, Montreal). The examiners sent by the Royal College of Surgeons will be Professor W. Wright and Professor J. Mellanby.

Mr. Edward Grainger Muir, M.R.C.S., of the Middlesex Hospital, who passed the Final Fellowship in June, 1929, but has not reached the age qualification for the diploma, was appointed Bernhard Baron Research Scholar, the subject of his research to be the pathology of the prostate.

Appointment of Librarian

Mr. W. R. Le Fanu, M.A., was appointed Librarian from October 1st next.

Plarr's Lives of the Fellows

Sir D'Arcy Power, the honorary librarian, presented the two volumes of Plarr's *Lives of the Fellows*. The best thanks of the Council were given to Sir D'Arcy Power, Mr. W. G. Spencer, and Mr. G. E. Gask for their services in revising and preparing this work for publication. The volumes can be purchased from Messrs. John Wright & Sons for two guineas (cloth) or three guineas (leather).

Lister Memorial Lecture

The President reported that the Lister Memorial Lecture on "Neuro-hypophyseal Mechanisms from the Clinical Standpoint" was delivered by Professor Harvey Cushing on July 9th, and that he had presented to him the Lister Medal.

Lecturers

The Council elected the following Professors and Lecturers for the ensuing year,

Hunterian Professors.—Sir Arthur Keith (six lectures on recent advances in human embryology). Victor Bonney (one lecture on the conservative surgery of uterine fibroids (myomectomy)), Harold Robert Dew (one lecture on hydatid disease—some interesting complications), John Basil Hume (one lecture on the pathology of diaphragmatic hernia). James Paterson Ross (one lecture on the treatment of cerebral tumours with radium, with an account of experiments made to study the effects of radium upon cerebral tissue), David Howard Patey (one lecture on the pathological basis of the treatment of varicose veins by injections, and its bearing on the problems of thrombosis). James William Tudor Thomas (one lecture on successful grafting of the cornea in rabbits).

Arris and Gale Lecturers.—Thomas Peel Dunhill, C.M.G. (one lecture on malignant disease of the thyroid gland—the relation of the incidence and spread to its embryology and prognosis), Donald Hunter (one lecture on metabolic diseases of bone). Herbert Henry Woollard (one lecture on the potency of the pharyngeal entoderm).

Erasmus Wilson Lecturers.—Clement Edward Shattock (two demonstrations on Reg[illegible]). Cecil Pembrey Grey Wakeley (two demonstrations on [illegible]ward Patey (one demonstration on pathology), (one demonstration on pathology).

Arnott Demonstrator.—Sir Arthur Keith (six demonstrations on the contents of the Museum).

Gilbert Blane Medal

The Secretary reported that the Sir Gilbert Blane Gold Medal for 1930 had been awarded to Surgeon Lieutenant-Commander James P. H. Gaussen, M.B., Ch.B., R.N., in respect of the promotion examination, 1930.

Appointment of Representative

The President was appointed as delegate to the celebration on October 13th, 1930, of the Jubilee of the foundation of Mason Science College and the thirtieth anniversary of the granting of the University of Birmingham charter.

Buckston Browne Dinner

The Buckston Browne Annual Dinner of Fellows and Members will be held on Thursday, November 13th.

Election of Officers

The following officers were elected for the ensuing year: President, Lord Moynihan; Vice-Presidents, Mr. C. H. Fagge and Mr. R. P. Rowlands; Physiological Curator, Mr. R. H. Burne; Pathological Curator, Mr. C. F. Beadles; Honorary Curator of Odontological Collection, Sir Frank Colyer; Honorary Curator of Historical Collection, Mr. C. J. S. Thompson.

Obituary

FRANK E. TAYLOR, M.A., M.Sc., M.D., F.R.C.S., M.R.C.P.

DR. FRANK EDWARD TAYLOR, whose death occurred suddenly on July 1st, was born in Leeds in 1872. He was educated at the Leeds Boys' Modern School and at the Yorkshire College (Victoria University), Leeds, taking the B.A. degree in 1891, after which he entered the medical department of the same college. In 1897 he graduated M.B., Ch.B. Vict., and obtained the diplomas M.R.C.S. Eng. and L.R.C.P. Lond. He held the post of house-surgeon at the Leeds General Infirmary, and then, deciding to specialize in obstetrics and gynaecology, he obtained resident appointments in these branches in Leeds and London after which he matriculated at the University of Berlin in 1899. Since the Boer war was in progress he joined the South African Field Force as civil surgeon, and was awarded the medal and three clasps for his services. On his return from this campaign Dr. Taylor further studied his chosen specialty and added to his qualifications, taking the F.R.C.S. Eng. in 1903, graduating M.B., B.S. Lond. in 1904, and becoming M.R.C.P. Lond. in 1905. In 1906 he proceeded M.D. Lond., obtained the diploma D.P.H. Camb., and graduated M.A. and M.Sc. at Leeds. He was then appointed gynaecologist to the North-West London and Hampstead General Hospital, the St. Marylebone General Hospital, and the Eastern Dispensary.

Dr. Taylor's career seemed now assured, but a period of ill-health followed, compelling him to relinquish his gynaecological work in 1912 and maintaining its hold upon him for the remainder of his life. Nevertheless he refused to give in, and having been appointed lecturer in bacteriology at King's College, London, in 1907, thereafter devoted himself to teaching and research in bacteriology and pathology. In addition to his King's College appointment, he acted for some years as pathologist to the Royal Westminster Ophthalmic Hospital, and, during the war, to the Lewisham War Hospital, he had recently been in charge of the vaccine laboratory of the Royal Herbert Hospital.

Frank Taylor was an excellent teacher, he possessed considerable literary ability and originality, and was the author of numerous papers. These in the earlier part of his career were mainly gynaecological, but later on he turned to pathological subjects, and published numerous investigations on the Arneth blood count, vaccines, the absorption test, mycological tests for sugars, Vincent's angina and fusospirillary peridental gingivitis, the *Diplobacillus liquefaciens* of Petit, and many other subjects. For many years he was an examiner on the Central Midwives Board and an occasional contributor to the *British Medical Journal*. He leaves a widow, but no family.

The sudden and untimely death of Dr. ALEXANDER NICHOLAS ROSS, on July 5th, came as a great shock to the members of the medical profession on Tees-side. Born in Ross-shire in 1880, he received his early education at the Royal Academy, Tain. His first interest was engineering, but after about a year of study in Glasgow he forsook this subject for medicine, and graduated M.B., Ch.B. at Aberdeen in 1904. He then assisted his brother, who was in practice in West Hartlepool, after two years there he spent a year in South Africa as an assistant. In 1908 he settled in Stockton-on-Tees, and built up a very large practice. He was an honorary physician on the staff of the Stockton and Thornaby Hospital, and a member of the British Medical Association, being chairman of the Stockton Division for two years. He was also a member of the Rotary Club.

A colleague writes: Ross was one of the most straightforward of men and of high ideals. Of most kindly and cheerful disposition, he was held in the greatest esteem by all his colleagues. He never spared himself in his work, and brought great comfort and cheer to his many patients. He gave the same self-sacrificing care to everybody. Undoubtedly he overworked himself, he left his surgery on the evening of July 1st to go home to bed with pneumonia, from which he died on the following Saturday morning. His was, in truth, a life devoted to his fellow men. The deepest sympathy is felt for his widow and two sons, the elder of whom enters Cambridge this year to study medicine.

DR. GAVIN B. CLARK, who died at Hampstead on July 5th at the age of 83, was a prominent political figure in the eighties and nineties. After taking the M.D. and F.R.C.S.Ed., he travelled for some years and then settled in practice in South London. But socialistic ideals early attracted him, and in 1885 he was elected M.P. for Caithness as an independent member, though he practically always voted with the radical wing of the Liberal party. Home Rule for Ireland and the Crofters Acts were at this time the measures which most particularly claimed his attention, and he was an ardent supporter

of women's suffrage, progressive self government for India, and international peace. Dr. Clark was early associated with South Africa and in the eighties was appointed Consul General for the South African Republic a post he resigned some two years before the South African war. With Mr. Lloyd George and other Liberals he took the unpopular view of the war, and was one of the most bitterly attacked "Pro Boers" in the country. After the loss of his seat in the General Election of 1900 he did not endeavour again to enter Parliament though he was persuaded to fight in the interests of Labour against Sir John Pratt at Glasgow in 1918. He found a more effective outlet for his energies in the numerous societies and organizations of which he was a member. Despite his lifelong advocacy of peace, Dr. Clark was convinced that the cause of Britain in the great war was just. At the commencement of hostilities he interested himself in the Belgian relief movement, and he played an active part in the Wounded Allies Relief Committee, which established hospitals in France and Serbia. For these services he received the Belgian Order of the Crown and the Serbian Order of St. Sava. Dr. Clark was a man of great force of character and wide interests. His sympathies were always with those needing help, and he never lacked courage in espousing an unpopular cause. The Prime Minister writes of him: He has had a long and very useful life, and his name will always be associated with two great causes which he served with singular devotion—the Highlands and Peace." Dr. Clark leaves a widow and one son and a daughter (Mrs. W. A. Brend). A younger son, Captain W. B. Clark, R.A.M.C., was killed in the war.

Medical News.

PROFESSOR ARTHUR J. HALL has accepted an invitation from the Medical Association of South Africa (British Medical Association) to read a paper on epidemic encephalitis before the South Transvaal Branch, during his visit to Johannesburg as the representative of Great Britain at the International Conference on Silicosis.

PRINCE GEORGE will open the new cabinet making workshop at Papworth Village Settlement on Wednesday, July 23rd, at 2.30 p.m., and subsequently the West Cambridgeshire flower show will be held in the grounds of Papworth Hall.

THE Duke of Connaught, on July 15th, unveiled a bust of the late Mr. Bernhard Baron in the main hall of the Royal Westminster Ophthalmic Hospital. His Royal Highness recalled that Mr. Baron during the years he spent in England, his adopted country gave over £2,000,000 to charity.

THE Home Secretary announces that in accordance with a recommendation of the Health Committee of the League of Nations communicated to His Majesty's Government by the Council of the League, an Order in Council has been issued under the Dangerous Drugs Act, 1920, extending Part III. of that Act, which provides for the control of morphine, heroin, and cocaine, to dihydromorphinone, its salts and any preparation admixture extract, or other substance containing any proportion of dihydromorphinone. The effect of the Order is that this drug (the trade name for which is dilaudide), its salts, preparations, etc., may not be imported into or exported from the United Kingdom and Northern Ireland without a licence issued by the Secretary of State under the Dangerous Drugs Acts, and as regards internal control the Dangerous Drugs (Consolidation) Regulations 1928, will apply. Dilaudide is not manufactured in this country.

THE Royal Society announces in our advertisement columns that it is prepared to receive applications for a Lawrence Research Studentship to be awarded for one year for research in some subject related to the cause and cure of disease in man and animals. The sum available will not be more than £200 but the Council will be prepared to consider an award to the holder of a stipend from some other source the total emolument will not exceed £350. Applications must be sent in by October 11th, on forms to be obtained from the assistant secretary, Royal Society, Burlington House, London, W.1.

THE Fellowship of Medicine announces that from July 21st to August 2nd there will be a special course in diseases of infants at the Infants Hospital, Vincent Square, S.W.1, each afternoon from 2 o'clock. In addition to lectures and demonstrations there will be special visits to the United Dairies Pasteurizing Plant, Willesden, and the V.D. Centre, Thavies Inn. From August 5th to 31st a special course in urology will be held at the All Saints Hospital, Vauxhall Bridge Road, during the afternoons and early evenings and comprising clinical and cystoscopic demonstrations. From August 11th to 16th a special course in diseases of the chest at the Brompton Hospital will occupy the whole of each day with demonstrations, lectures, and operations. The general course of the Fellowship continues throughout the month consisting of attendance at the clinical practice of fifty London special and general hospitals. Programme tickets and further details may be obtained from the secretary of the Fellowship, 1 Wimpole Street, W.1.

AN international post-graduate course will be held in Vienna from September 29th to October 12th, occupying the whole of each day and including lectures and demonstrations on the more important new therapeutic preparations and lines of treatment. Further information may be obtained from the secretary of the International Post-graduate Courses, Dr. A. Kronfeld, Porzellangasse 22, Vienna IX.

AT a *quarterly court of the directors of the Society for Relief of Widows and Orphans of Medical Men* held on July 9th a total sum of £2,151 5s. was voted in grants to the widows and orphans who are receiving relief for the half-year July 1st to December 31st. Widows over 65 years of age received £37 10s. each, those under 65 £35, and the orphans £25 each. At the present time there are 51 widows and 12 orphans on the books. Relief is only granted to the necessitous widows and orphans of deceased members of the society. Any widow of a member who is left with an income of £125 or under is eligible to such relief as the court of directors think fit to grant her. Membership is open to any registered medical practitioner who at the time of his election is residing within a twenty-mile radius of Charing Cross. The secretary will be pleased to send further particulars to any medical man within that radius who may be desirous of joining the society.

THE first International Congress of Neurology will be held at Berne from August 31st to September 4th, 1931, when the following four subjects will be discussed: (1) diagnosis and treatment of cerebral tumours; (2) anatomy, physiology, and pathology of muscular tone; (3) acute suppurative infections of the nervous system; (4) the role of trauma in the production of nervous symptoms.

THE ninth Roumanian Congress of Oto-rhino-laryngology will be held at the Coltea Hospital, Bucarest, under the presidency of Dr. A. Costinin, on October 25th and 26th, when the subject for discussion will be radiography in oto-rhino-laryngology introduced by Drs. I. Tetu, Jovin, and Andreoescu. Further information can be obtained from the general secretary, Dr. Lazar Mayersohn, Calea Mosilor 81, Bucarest.

THE first Congress of the International Society of Experimental Phonetics, held at Bonn last month, was attended by nearly 100 persons. A prominent feature of the proceedings was a demonstration of *x* ray films of the vocal organs during speech by Dr. H. Gutzmann (Berlin), the movements of lips, tongue, uvula, hyoid bone, and larynx were seen with striking clearness. Professor M. Isserlin (Munich) spoke on problems of aphasia. Dr. Kaiser (Amsterdam) described the registration of pathologically altered voices, and Dr. Berger (Münster) described investigations of the Lombard test. Among the exhibits was one from the West End Hospital for Nervous Diseases (London) showing voice records in nervous diseases. Professor Schilling (Freiburg) described an electric method of registering tongue and palate conditions and Dr. Zwirner (Berlin) showed speech curves from cases of depression. Several papers and demonstrations were concerned with registration by the oscillograph, and the nature of the vowels. Profes or E. W. Scripture (Vienna) explained his theory of speech atoms and speech molecules, and Mr. F. Janvrin (London) presented an experimental analysis of a record of verse spoken by John Galsworthy himself. Nearly a dozen papers presented the results of experimental phonetics in linguistic problems. The proceedings of the congress will be published in a volume of about 128 pages costing 10s. At a meeting of the council it was decided that the membership fee should be 10s. a year, to be sent to the Secretarial Bureau, 73 Welbeck Street, W.1. It was also decided that the following publications should be sent free of charge to the members: *Zeitschrift für Experimental Phonetik*, *Bulletin of the International Society of Experimental Phonetics*, *Bulletin de la Société Internationale de Phonetique Experimentale* and *Sprachneuro og echie Mitteilungen*.

THE fifth Congress of French-speaking Psycho-analysts was recently held at the Asyle Ste. Anne, Paris, when papers were read by MM. Hesnard and Laforgue on the psychical mechanism of auto-punishment in the psychology of neuroses and psychoses, criminal psychology, and general pathology; by Mme. Bonaparte on the prophylaxis of neuroses in children, and by Mme. Morgenstern on the place of psychoanalysis in mental hygiene.

Letters, Notes, and Answers.

All communications in regard to editorial business should be addressed to ***The EDITOR, British Medical Journal, British Medical Association House, Tavistock Square, W C 1***

ORIGINAL ARTICLES and LETTERS forwarded for publication are understood to be offered to the *British Medical Journal* alone unless the contrary be stated Correspondents who wish notice to be taken of their communications should authenticate them with their names not necessarily for publication

Authors desiring REPRINTS of their articles published in the *British Medical Journal* must communicate with the Financial Secretary and Business Manager, British Medical Association House, Tavistock Square, W C 1, on receipt of proofs

All communications with reference to ADVERTISEMENTS as well as orders for copies of the *Journal* should be addressed to the Financial Secretary and Business Manager

FINANCIAL SECRETARY AND BUSINESS MANAGER (Advertisements, etc), *Articulate Westcent, London*

MEDICAL SECRETARY, *Mediocera Westcent London*

The address of the Irish Office of the British Medical Association is 16, South Frederick Street, Dublin (telegrams *Bacillus Dublin*, telephone 62550 Dublin), and of the Scottish Office 7, Drumsheugh Gardens, Edinburgh (telegrams *Associate, Edinburgh*, telephone 24361 Edinburgh)

QUERIES AND ANSWERS

DIET IN RHEUMATISM

DR GRAHAM GRANT (Gray's Inn, W C) writes We are constantly being asked by elderly patients suffering from recurring attacks of subacute rheumatism what to eat, drink, and avoid, and we are charged with giving conflicting opinions when so consulted Some medical men advise lemons others disapprove, some permit beer as a beverage, others hold up their hands in horror (although brewers' labourers do not seem to have rheumatic ailments more than other classes of the community), and endless other instances of divergence can be mentioned, which leave the unfortunate patient with the fear that everything he is eating or drinking may make him worse Can any of your readers supply me with a dietary which is a safe one without being too ascetic?

CLOTHES MOTHS

DR R E DRAKE BROCKMAN writes in reply to "H G," whose inquiry was printed last week —An infallible method, which I devised after much loss from the depredations of clothes-moths, is as follows If the clothes are stored in drawers or boxes, get some cheap thin white cloth or linen and have it made into bags which should be just larger than the drawer or box Divide the bag into numerous divisions 4 in wide by sewing across it Into each of the divisions put a reasonable amount of crude naphthalene and close the ends of the partitions When complete it looks something like a cork mattress, but of course, only a small quantity of naphthalene is put in each partition This mattress of naphthalene should be laid on top of the clothes next to the lid of the box and will be found a certain protection against moths I have thus kept my clothes moth free for over twenty years Of course, the clothes should be taken out a few days before use and thoroughly aired, if possible in the sun, to rid them of the smell of naphthalene

CLEANSING OF THE CHALICE

"MEDICUS" asks if there is any evidence that neglect to wipe the chalice between each participant during the Communion Service may give rise to the transmission of such an infection as pyorrhoea His own view at present is that although it would seem cleanly to use a purificator, yet even this is hardly efficient as a means of eliminating risk of infection

BROMIDROSIS

"A A" writes I should advise "R B C (July 12th, p 86) to try a thorough and prolonged soaping every night with hot water and bimodide soap (Parke Davis's neko), and then rub in formaldehyde sap (diluted, if necessary, to half or one third strength) into the wet skin of the soles and between the toes Suitable diet and a belladonna mixture would discourage sweating Light socks should be worn, and it is beneficial to go barefoot whenever possible

INCOME TAX

Return to United Kingdom

"G H A who is at present residing and working outside the United Kingdom inquires on what basis his earnings would be assessed in this country if he came to reside and work here

The amount of the liability would not be affected by his present earnings abroad on coming to this country a new basis would be adopted That basis would be period to April 5th of the first year the amount of that year's earnings, second year, the amount of the earnings of the first twelve months' in the United Kingdom, third year, the amount of the earnings of the second year, or of the third year if less, after that, the previous year throughout This, of course, assumes that "G H A" does not buy a share in a practice, in that case the previous profits of that practice would normally determine his liability, but in neither case would his present earnings enter into the calculation

Succession to Practice Cash Basis

"ELM" was assistant to his father in a general practice from December 1924, to April, 1928 when he took over the practice, for which he is now paying He is informed that the authorities require the returns to be made on the basis of the bookings of the practice, which would involve heavy labour in preparing the statements and estimating the amount of bad debts

*** We assume that "Elm" has not included in the cash receipts for the purpose of the income tax statements the cash received for work done prior to April, 1928 In that case the returns have undoubtedly not reflected the full earnings of the practice, but only that portion which has been received as cash The attitude of the revenue authorities is correct, but perhaps a compromise could be arranged on the basis of revising the calculations to include *all* cash receipts, whether belonging to "Elm" or his father

Car Allowance

"V F F" was in partnership until September 30th, 1929, was unemployed to January 1st, 1930, and was then an assistant until April 1st, 1930, in a practice in which he acquired a partnership as from that date What depreciation allowance can he claim in respect of the income earned in these periods?

*** Nothing can now be done as regards the income tax payable in respect of the share in the old practice, depreciation allowance should have been claimed at the time (2) Strictly the same applies to the three months' employment earnings, though if that liability has not been settled yet, the inspector of taxes will perhaps admit a claim now to wear and tear allowance for the last quarter of the year 1929-30—that is, one fourth of 20 per cent of £200=£10 (3) For the year 1930-31 the new partnership's wear and tear claim is increased by the addition of "V F F's" car to those in partnership use, and the increase will be the amount of the 1930-31 claim on his car—that is, 20 per cent of £160=£32

LETTERS NOTES ETC

OSTEITIS FIBROSA

WITH reference to the case of osteitis fibrosa, with initial symptoms resembling rheumatic infection, described by Drs J Salisbury Craig and James H Shearer in the *Journal* of July 5th (p 9), Dr J Tertius Clarke has asked the authors to explain why it was considered that the initial symptoms resembled rheumatic infection

DR SALISBURY CRAIG replies The complaint of pain over the posterior aspect of the neck, the left deltoid region, and the left upper arm, together with the tenderness over those regions, were the initial features of the case which led the authors to suspect fibrositis The subsequent development of mild pyrexia and pain in the left infra-axillary region, associated with the mitral stenosis, were regarded as further points in favour of a rheumatic infection

PRURITUS ANI

"CERONS" wishes to thank readers who have replied to his query about pruritus ani So many (he says) have written to me about this distressing complaint that I find it difficult to reply to each one individually, and I hope that they will accept this formality instead

A ROAD ACCIDENT

MR ARTHUR S NICOLL (25, Ringstead Road, Catford S E 6) writes May I endeavour through your columns to get in touch with the medical man who witnessed the accident to a motor cyclist and pillion rider, who were run down by a car, on the way to Hastings on Sunday, June 22nd about 12 30 p m ? The doctor gave me his card at the time, but this has unfortunately been lost

MEDICAL GOLF

A British Medical Association Golfing Society for Sussex has been started, and the first meeting will be held on the links of the Brighton and Hove Golf Club on Sunday, September 28th A competition of 18 holes under handicap against bogey will take place The captain, Colonel Dee is offering a prize for this The honorary secretaries of the society are Dr J H Twiston Davies and Mr Harold Downer All communications should be addressed to 40, Wilbury Road, Hove

VACANCIES

NOTIFICATIONS of offices vacant in universities medical colleges, and of vacant resident and other appointments at hospitals, will be found at pages 42, 43 44, 45 46 47 48 49 52 and 53 of our advertisement columns, and advertisements as to partnerships, assistantships and locumtenencies at pages 50 and 51

A short summary of vacant posts notified in the advertisement columns appears in the *Supplement* at page 27

EPITOME OF CURRENT MEDICAL LITERATURE

Medicine.

51 Post vaccinal Encephalitis

N CARRARA (*La Pediatria* April 15th, 1930, p 451) doubts whether the various nervous manifestations attributed to post vaccinal encephalitis are due directly to the vaccine he considers that the evidence is so contradictory that it is impossible to give a decisive answer one way or the other On the whole he sums up against the suggestion that vaccination stimulates into activity the virus of epidemic or herpetic encephalitis Some cases suggest the possibility of contamination of the lymph with other organisms, or the action of organisms already in the system It is generally thought that manifestations are those of a non purulent inflammation which somewhat resembles the encephalitis occasionally seen after measles it affects the meninges alone or part of the brain or the medulla initiating perivascular glial proliferation especially in the white substance The incubation period ranges from nine to fourteen days, and the disease begins abruptly as one of three main types—namely the meningeal, the meningo encephalitic, and the myelitic In fatal cases death rarely is postponed more than ten days In patients who recover sequels are not very common as contrasted with what occurs in epidemic encephalitis they usually take the form of psychic disturbances In diagnosis the sudden onset of the disease and the absence of eye phenomena, the less polymorphic character of the symptoms and the presence of the Babinski sign are more suggestive of post vaccinal encephalitis than of the epidemic form The mortality is high (30 to 58 per cent), especially in England The disease is almost confined to children between the ages of 3 and 13 who have been vaccinated then for the first time The rarity of it is shown by the fact that only about 400 cases have been recorded in the last twenty years out of the enormous number of people who have been vaccinated, of these, about 200 occurred in Holland 100 in England and 100 in Germany As regards prophylaxis, a single mark vaccination is suggested, although there seems to be little relation between the activity of the reaction and the development of encephalitis even the virulence of the lymph seems to have only relative importance During an epidemic of encephalitis it would probably be wise to postpone vaccination Treatment is chiefly symptomatic

52. Gonorrhoeal Endocarditis with Recovery

M W PERRY (*Amer Journ Med Sci* May 1930 p 599) gives a detailed report of a case of gonorrhoeal endocarditis in a man aged 22 A history of gonorrhoea was followed by a prolonged intermittent fever, associated with a low grade leucocytosis of 10,000 to 15 000 , there was a diastolic murmur of varying intensity situated over the pulmonary area On one occasion a pure culture of gonococci was obtained from the blood taken immediately after a severe rigor From this culture an autogenous vaccine was prepared containing 400 million gonococci per cubic centimetre the patient received 0 2 c.cm , but on each occasion its injection was followed by a severe reaction, and seemed to have a harmful effect, and only three injections were therefore given Although there was no marked anaemia the patient had fourteen transfusions (250 c cm each) of citrated blood over a period of two months On three occasions acute symptoms pointing to pulmonary embolism were noted associated with sudden severe pain in the chest and expectoration of blood Following the last of these attacks the general condition began to improve and the patient was discharged a month later after about three months treatment, during this time a liberal food intake was maintained, and there was but slight loss in weight On discharge the heart murmur remained unchanged, there was some impairment to percussion over the left base and lower axillary region, with diminished intensity of the breath sounds A year later the patient was in good health

53 Juvenile and Adult Types of Tuberculosis.

THE fact that in childhood tuberculosis lesions may be found in any part of the lung parenchyma and also in the tracheobronchial glands is attributed by J A. MYERS (*Minnesota Med* April 1930 p 209) to the fact that they are the result of a first infection, no acquired immunity yet being present the lung parenchyma has no power to localize the infection and the bacilli quickly pass on to the lymph glands Childhood lesions frequently become caseous and later calcified cavity formation is rare, as also is fibrosis In the adult type of infection the lesion is most frequently found at the apex below the clavicle While admitting that the adult type is sometimes found in childhood the author considers that it is the result of a reinfection , he is disposed to disagree with Ranke s hypothesis that the adult type of disease is directly developed from that of childhood It has been possible to prove the pre existence of a childhood infection in 50 per cent of cases of the adult type It is considered that the percentage is probably greater, since radiology often fails to demonstrate lesions which are plain enough at necropsy Copies of radiograms are included by Myers to show the coexistence of signs of childhood and adult disease and also the later development of adult disease where previously only childhood lesions had been visible In many of the latter the adult type of disease had followed continued exposure to a known source of infection Family histories are reported to indicate that tuberculosis is essentially a family disease, and that the existence of signs of childhood disease should make the physician particularly careful to remove the subject from the possibility of reinfection by contact

54 Acute Rheumatic Myocarditis.

G ETIENNE (*Arch des Mal du Cœur* March 1930, p 153) emphasizes the existence of a form of acute rheumatic myocarditis in which the manifestations of cardiac insufficiency dominate the clinical picture and rheumatic pains are either absent or very slight An account is given of six instances of this form of myocarditis The first two patients had no rheumatism, but in one of them forty years previously there had been an acute attack, in both there was an abrupt onset of cardiac failure with fever, weak heart sounds, and dilatation of the heart In the other four cases mild arthritic symptoms were present with similar manifestations of cardiac embarrassment the latter forming by far the most striking part of the clinical picture While classical chronic rheumatic myocarditis has ultimately a poor prognosis, this acute form frequently clears up completely, leaving no disability of any sort Several of the patients described by the author were free from symptoms between two and four years after the illness Such good results depend upon energetic and appropriate treatment A rheumatic origin should be suspected when there is sudden illness with fever and evidence of cardiac insufficiency Salicylates should be administered, at first by intravenous injections and subsequently by the mouth the cardiac insufficiency should be treated simultaneously with camphor oil strychnine, and ouabain Digitalis administration is sometimes of considerable value

Surgery.

55 Benign Gastric Tumours.

E DOMALIG (*Wien Klin Woch* , April 24th, 1930, p 526) remarks that although cases have been frequently recorded in specialist journals during the last ten years, there is no general recognition of the symptomatology of benign tumours of the stomach and wrong diagnoses are made because the condition is not borne in mind Their frequency is variously reported as about 0 5 to 1 25 per cent of all gastric tumours Myomata are the commonest, after which follow polypi and fibromata They may occur as subserous tumours which usually give rise to no symptoms except by their size the weight may reach several kilograms Submucous tumours may develop also and these form the important clinical group Benign tumours appear in both sexes and at all ages but they are more common in the middle and late periods of life Heredity plays a part only in the case of the polypi The complaint is always pain which is localized to the region of the stomach and does not spread in any direction. It occurs almost immediately after a meal irrespective of the type of food eaten and lasts from one to three hours The pain is rarely severe and has therefore usually existed for months or years when the patient presents himself for examination It lacks the periodicity so typical of ulcer, and is described as a feeling of pressure or fullness The patient is always free from pain when the stomach is empty Vomiting is rare the appetite is little influenced and the general condition remains good unless complications occur Examination of the patient shows localized tenderness If a tumour or resistance can be felt (which is rarely the case) it is freely movable The acidity of the gastric juice is normal or low , occult blood is found in the stools if released

search is made An *x* ray examination may show a sharply defined filling defect in the stomach, with normal peristalsis and mobility Polypi have a characteristic outline The complications are chronic haemorrhage giving rise to severe anaemia, acute haemorrhage, which is sometimes severe and fatal, pyloric stenosis, ulceration in the region of the tumour, and malignant change These alter the clinical picture to that of the superadded condition A differential diagnosis has to be made from gastric ulcer, chronic gastritis, and carcinoma The treatment may be local resection of the tumour-bearing area, but gastrectomy is often performed since it has become a recognized operation, and proof of the innocence of the tumour may be lacking until sections are made The author records two cases, in one of which a peptic ulcer occurred in the centre of the tumour

56 Diverticulosis of the Colon

ACCORDING to F W RANKIN and P W BROWN (*Surg., Gynecol. and Obstet.*, May, 1930, p 836) diverticulosis, or sacculations along the lumen of the large bowel, is a condition uniformly asymptomatic except in a few cases in which inflammatory reactions are occurring secondarily to the irritating processes It is present in about 5 per cent of patients who have symptoms referable to the large bowel, but probably actually exists in 1 per cent of all persons Diverticulitis occurs as a rule in about 17 per cent of cases of diverticulosis, and is usually chronic and subject to exacerbations The etiology of diverticulosis is obscure, but it may result from improper emptying of the bottle shaped sacculations (with subsequent inflammation, necrosis, and occasional perforation), due to inherent muscular weakness in the bowel wall and environmental conditions, obesity, and constipation The relationship of this condition to carcinoma is probably incidental rather than actual, in 22 cases reviewed by the authors such associated malignancy was found in only 4 Diverticulitis occurs almost entirely in middle aged persons of a corpulent tendency who lead sedentary lives The outstanding symptom is pain, usually referred to the lower left part of the abdomen and frequently associated with constipation Bleeding is not common, but if it is present an erroneous diagnosis of malignancy is often made Tumefaction is common and is usually the result of inflammatory reactions, with or without abscess formation, in itself it does not indicate malignancy Diverticulitis usually yields to medical and dietetic measures The treatment of an acute attack consists in watchful waiting while the patient is in bed and is receiving irrigations of the affected segment with warm sodium chloride and other sedative solutions As the process subsides, anti constipation diet and small oral doses of mineral oil are given A dietary regimen is is highly essential and often prevents complications, the most common of which are abscess, fistula, and perforation Treatment of the complications is usually surgical, primary resection is dangerous, and the operation of choice is a graded procedure, consisting of drainage with subsequent resection and anastomosis Prolonged drainage by colostomy will often bring about complete recession of the tumefactions and symptoms, rendering further intervention unnecessary

57 Mesenteric Cysts

C W FLYNN (*Annals of Surgery*, April, 1930, p 505) describes mesenteric tumours as being the rarest variety of tumour met with in the abdomen, cysts being more common than solid tumours in this situation Mesenteric cysts of embryonic origin may be classified as cysts of intestinal origin, dermoid cysts, and cysts arising from retroperitoneal organs Mesenteric cysts develop more often in women than men, and most often in the third decade They occur generally to the right of the median line and below the umbilicus, trauma is an important causative factor Diagnosis, owing to the lack of characteristic symptoms, is never made before operation, although a mesenteric cyst should be suspected when an abdominal tumour which is smooth, round, apparently cystic, and mobile is present, associated with recurrent attacks of abdominal pain, nausea, and vomiting There may be constipation alternating with diarrhoea, but usually there is no loss of weight, and there may even be an increase Treatment is always surgical, and must vary according to the case Sometimes drainage is sufficient, although a persisting sinus may have to be resected later The mortality is about 6 per cent with this method of treatment Enucleation is the best form of treatment when possible, and gives good results when the tumour can be completely removed, the mortality is about 16 per cent Resection is indicated if the tumour cannot be removed without interfering with the circulation of the bowel The high mortality of 60 per cent is due to the fact that in this type of case intestinal obstruction and sometimes local peritonitis have developed before operation A case is reported of a large tumour occurring in a girl aged 16 The tumour was firm and contained many small cysts lined with endothelium and turbid fluid It was found to be a lymphangioma and cystic in type, developed from the first portion of the mesentery of the jejunum The symptoms were cramp, colic, and marked constipation Resection of a large section of the jejunum together with the tumour was successfully performed, and the patient made an excellent recovery

Therapeutics.

58 Serum Treatment of Typhoid Fever

P P RAVAULT and D NODRIN (*Journ. de Méd. de Paris*, April 10th, 1930, p 312) record their observations on 38 cases of typhoid fever in a Lyons hospital, 22 of which were treated by Rodet's serum, 30 or 40 c cm were injected on admission, and a similar dose was repeated on each of the four or five following days In some severe cases with high temperature 60 to 80 c cm were given daily, or even as much as 120 to 130 c cm in the twenty four hours In such cases the total quantity of serum given amounted to 150 or 160 c cm, and some patients received even higher doses The twelve patients who did not have serum injections had either mild attacks or were late and complicated cases The results in the 22 patients who were treated by serum are classified in three groups (1) favourable results, in which the administration of serum was accompanied by a permanent fall of the fever and general improvement, (2) doubtful results, the patients after a transient fall of temperature or slight improvement of their symptoms having a fresh rise of temperature, or developing a complication such as phlebitis, and (3) cases in which the serum had no effect In most instances the serum reactions consisted in more or less generalized urticarial or scarlatiniform rashes, but four patients had very severe serum sickness with high fever and generalized arthralgia, this occurred during defervescence or convalescence, and considerably retarded recovery The serum had no effect on the severe forms, and, though it might be of use in the moderate forms by shortening the disease, this benefit was counterbalanced by the severity of the serum reactions Rodet's serum, therefore, is considered by the authors to be in no wise comparable as regards efficacy with diphtheria or tetanus antitoxin, or even antimeningococcal serum

59 Medicinal Treatment of Intestinal Tuberculosis

JUDGING from the effective results obtained by artificial heliotherapy and cod liver oil, which are equally beneficial and practically interchangeable, in the treatment of rickets, and by the use of the first in intestinal tuberculosis, M MCCONKEY (*Amer. Rev. of Tuberculosis*, May, 1930, p 627) considered that cod liver oil might prove equally effective in this disease The results obtained in the treatment of 50 cases with cod liver oil and tomato juice are recorded In earlier cases the oil was given alone, but as better results were noted following the administration of orange juice with the oil, the juice was also used in the routine treatment, later the cheaper but equally efficacious tomato juice was substituted For purposes of comparison, 128 cases of intestinal tuberculosis complicating disease of the lungs were observed, 28 of these received only palliative treatment, 50 were given ultra violet radiation, and 50 received the cod liver oil and tomato juice mixture There was no great difference in the severity of the intestinal symptoms or general condition of the patients, and the diagnosis of the intestinal condition was determined solely by radiological findings McConkey reports that of the untreated group 71 per cent are dead, 14 per cent are alive, of whom only one patient is able to do part-time work, and 14 per cent are untraced Of those receiving heliotherapy, 24 per cent have died, 42 per cent are alive, of whom 16 per cent are able to work, and 34 per cent are untraced Of those receiving cod liver oil and tomato juice, 10 per cent are dead, 86 per cent are alive, of whom 12 per cent can work, and 4 per cent are untraced The author thinks it probable that the symptoms in intestinal tuberculosis depend in some way on the calcium metabolism, and that this treatment possibly effects some change in the calcium metabolism which brings about immediate relief The method of administration is simple 3 oz of tomato juice are placed in a glass and on the surface is floated half an ounce of cod liver oil, the mixture is given ice cold immediately after meals The juice may ferment if kept longer than twenty four to forty eight hours, the juice of an average sized orange may be substituted where fermentation cannot be avoided The method is said to have no contraindications, and may it is useful in the after care of radiated patients, and may also prove a means of preventing intestinal tuberculosis in many cases Patients with tubercle bacilli in the sputum who present either definite or questionable evidence of intestinal disease should be given adequate treatment before the lesion reaches a hopeless stage

60. Treatment of Epidemic Meningitis

J B NEAL (*New York State Journ of Med*, January 15th, 1930, p 79) gives an account of the method of treatment of the Meningitis Division of the Research Laboratory of the New York City Health Department which has been concerned with the treatment of more than 1 000 cases of epidemic meningitis Whenever the fluid obtained by lumbar puncture is cloudy or hazy, antimeningococcal serum warmed to body temperature is immediately introduced by gravity the further administration of serum depends on the results of cultures of the fluid Intrathecal injections are continued about every twenty four hours until at least two successive cultures show no organisms by smear or culture The usual dose is 20 c cm if as much or more fluid has been obtained If the amount of fluid withdrawn is great, and the serum runs in easily by gravity, 30 to 40 c cm of serum may sometimes be given If the fluid is under greatly increased pressure 50 to 60 c cm or more may be withdrawn It is rarely safe to give less than four injections of serum If signs of blocking develop reconrse should be made to ventricular or cisternal puncture Intravenous or intramuscular injection is indicated only in cases of meningococcal septicaemia without meningitis

Anaesthetics.

61 Explosive Anaesthetics

H B WILLIAMS (*Journ Amer Med Assoc*, March 29th, 1930 p 918) reporting for the committee of the physical therapy council of the American Medical Association upon the possibility of explosion of ethylene and other combustible gases used in inducing anaesthesia, considers that there is a real danger where ethylene or ether vapour is mixed with O or N_2O, and contained in or passed through rubber bags and tubing the risk is increased by the practice of washing out the apparatus with oxygen rich mixtures, and administering these to the patient Although every care may be taken when the cautery is used the fact that the mixture in the patient s lungs and upper air passages may become explosive by mingling with respired air is liable to be overlooked, and may result in a disaster Less obvious causes of ignition are the electric sparks which may result from the re establishment of electrical equilibrium after charges have accumulated in consequence of friction upon some insulated rubber portion of the apparatus Experimentally sufficient voltages to cause an explosion were obtained under favourable circumstances by friction of rubber surfaces against each other though the spark was quite small and almost noiseless The remedy advocated is the elimination of rubber the equipment being made conductive throughout Williams remarks that ethylene being more dangerous in this respect than ether, should never be used for operations with the cautery or diathermy apparatus, ether should never be employed in any throat operation with such instruments Care should also be taken not to comb or stroke the patient s hair until the ethylene has become thoroughly dissipated The majority of explosions with ethylene were bound to occur towards the end of the operation, and this, according to Williams may be due to the practice of washing out the patient s lungs with a mixture of O and CO_2

62. Local Anaesthesia with Percaine.

O GESSNER and J NAUHEIMER (*Schmerz Narcose Anaesthesie*, May, 1930 p 44) state that the quinoline derivative percaine is a very active drug its action extending to the central and peripheral nervous system as well as to organs with smooth and striped muscle A study of the comparative merits of percaine and of cocaine and novocain led to the following conclusions According to the authors investigations on the cornea of the rabbit, percaine is over 2,000 times more active than novocain, Lipschitz and Laubender find that it is at least 100 times more active than cocaine On the other hand Uhlmann reports that when it is injected subcutaneously it is five times more toxic than cocaine Percaine is also superior to cocaine in the readiness with which it can be sterilized and in the fact that the toxic dose of percaine does not vary like that of cocaine for the same species of animals If further experience shows that this drug is absorbed with as much difficulty by the human mucous membrane as it is by the frog s skin and that its use does not entail any risk of narcotic poisoning it will be clear that it possesses still more advantages over cocaine The authors add that as regards comparison of percaine with the ordinary infiltration and conduction anaesthetic novocain no final statement at present can be made

63. H BRUCHHOLZ (*Deut Zeit f Chir*, March 1930 p 202), as the result of his own observations and a study of over 4,000 cases reported in the literature comes to the conclusion that percaine, which is the hydrochlorate of butyl oxyl quinolin carbonic acid diethylaminoethylamide is an entirely non irritant local anaesthetic which experimentally and clinically is far superior to cocaine and the derivatives of cocaine hitherto employed both in efficiency and the duration of its action It can be used for infiltration conduction and surface anaesthesia as well as for the local treatment of painful wounds and ulcers in place of anaesthesin and anaesthoform For infiltration anaesthesia a 0.5 per 1,000 solution and for conduction anaesthesia a 1 per 1,000 solution are required When used in a strength of 1 to 2 per cent percaine acts as well as a 10 to 20 per cent solution of cocaine, and its action lasts considerably longer while in a 1 per cent solution it is far superior to alypin, psicaine and other cocaine derivatives for anaesthesia of the urethra and bladder The special practical advantages of percaine are the simplicity of its preparation its durability, and the readiness with which it can be sterilized as well as its cheapness In spite of its relatively high toxicity it can safely be used in the dilution and doses stated It is preferably injected in combination with suprarenin in doses of 400 c.cm of a 1 in 2,000 solution 150 c.cm of a 1 in 1 000 solution, or 50 c.cm of a 1 in 500 solution The maximal dose is about 0.2 gram percaine It is only on operations in the head, neck, and genital region that smaller doses should be used (up to 0 1 gram percaine) and if possible in combination with adrenaline. Percaine is also suitable for lumbar anaesthesia but further experiments are required to determine the optimal dose for this purpose

64 H DOENCH (*Zentralbl f Chir*, March 1st, 1930, p 518), who has employed percaine in about 130 cases, including hernias, tumours, hydroceles, appendicectomies, peritonitis, pancreatitis, artificial anus, bursitis etc, states that the chief objection to percaine lies in the long time (6 to 10 minutes) it takes to produce complete anaesthesia but this is counterbalanced by the great advantage of its protracted action (6 to 14 hours No toxic symptoms of any kind were observed

65. H FLÖRCKEN (*Zentralbl f Chir* April 5th, 1930, p 874), commenting on a recent paper by W Brandes[illegible] who drew attention to the persistent vomiting and deep necrosis of the skin following percaine anaesthesia, states that in his experience of about 400 cases he has never had any complications of this kind He attributes the occurrence of toxic vomiting to the fact that Brandesky did not add any adrenaline to his solutions Percaine without adrenaline causes first a transient local hyperaemia which is then followed by a certain degree of anaemia The toxic vomiting is probably due to too rapid absorption The occurrence of skin necrosis is more difficult to explain and is probably due to local infection not connected with the anaesthetic In the numerous cases in which Flörcken has used percaine he has never seen any necrosis of the skin and has therefore no reason to abandon its use as Brandesky has done, especially since it possesses the inestimable advantage of outlasting the period of pain can ed by the wound He regards it as essential not to exceed a dilution of 1 in 1 000 and always to add one or two drops of a 1 in 1,000 adrenaline solution

Obstetrics and Gynaecology.

66. The Female Sex Hormone.

R. T FRANK and M A. GOLDBERGER (*Journ Amer Med Assoc*, April 19th, 1930, p 1197) state that the female sex hormone can be extracted from various portions of the organism especially the ovarian follicle the corpus luteum and the placenta, and that it also occurs in the blood bile and urine This principle is essential for reproduction because it produces the oestrous and menstrual changes noted in the infertile as well as in the fertile sex cycle (pregnancy) Its local mode of action is unknown and it is not known whether the hormone is fixed used up or destroyed The authors have demonstrated that it occurs in five times greater concentration in the menstrual than in the circulating blood or in blood obtained from the cervix, this indicates that at any rate a concentration of the active substance takes place in the uterine mucosa Loewe and Lange demonstrated in 1926 that the female sex hormone is excreted in the urine of normal women These investigations are difficult and tedious, and the present workers have endeavoured, with satisfactory results, to correlate the blood and urinary observations with the hope of substituting urine examination for the blood test Studies were made on the

blood of normal menstruating and menstruating sterile women, of amenorrhoeic women, and also on the urine of non pregnant women The results are said to warrant the deduction that the amount of hormone produced is not necessarily an accurate index of its quantitative effects, which will depend on at least three factors the amount secreted, the rapidity with which the hormone is utilized or fixed in the genital tract, and the rate and level (threshold) at which the excretion takes place The renal threshold, particularly in the sterile and amenorrhoeic groups, is persistently and recognizably lowered The hormone is produced so rapidly that little effect on the sex tract is produced by the functioning ovaries In one group, amenorrhoea with comparative lack of uterine function is noted, in the other, sterility due to insufficient pregravid (premenstrual) uterine reaction results During pregnancy a very large amount of the hormone is excreted through the kidney The lowering of the urinary threshold to the hormone is significant and important, since amenorrhoea and sterility may result from it Evidence was also found suggesting the existence of a general law governing the urinary threshold excretion of all hormones

67 Clinical Diagnosis of Pregnancy.

ACCORDING to REEB (*Bull Soc d'Obstét et de Gynécol. de Paris*, March, 1930, p 211) the best diagnostic sign of pregnancy is a change of consistency or a slight contraction of the gravid uterus, which may be spontaneous or may be excited by light massage In certain cases this sign may be absent, or it may be feebly present in other states, such as submucous fibroma, under these conditions the diagnosis is uncertain A strong contraction of the uterus will clearly define its contours, will permit an estimation to be made of its volume, will differentiate it from adjacent tumours, will reduce its congestion and diminish the size of prominences which may suggest the existence of an extra uterine pregnancy, and will eliminate by its intensity the possibility of the presence of a fibroma Lorrinez has shown that the intravenous injection of small doses of posterior pituitary extract produces such a contraction Reeb has experimented with this drug in 8 cases, 5 patients were pregnant and 3 were not. The pregnancies were all between the third and fourth months, two being complicated by fibromata, one by a polyp, and one by an ovarian cyst with twisted pedicle, in one case a hydatidiform mole with luteinic cysts was present The intravenous injection of 0 4 to 0 5 c cm of the liquid extract excited a hard uterine contraction, which permitted of very precise localization and differentiation of the existing conditions The injection caused no ill effects to the patient, and did not interfere with the continuation of the pregnancy After the contraction, which lasted two or three minutes, the uterus returned to its original condition, no further contractions or haemorrhages were noted, and all the pregnancies continued to progress normally Reeb maintains that this method is a considerable aid in cases where the diagnosis is difficult

68 Hystero salpingography

C BECLÈRE (*Journ de Radiol et d'Electrol*, April, 1930, p 219) emphasizes the absolute need of a strict technique in hystero salpingography in order to obtain satisfactory results If the lipiodol injection is made under such unfavourable conditions as sepsis or pressure, very grave, and even fatal, accidents may occur If the injection is incomplete, all the necessary images are not obtained, and serious diagnostic errors may arise The most favourable moment for this examination is at the end of the first week after menstruation, and, since it constitutes an actual gynaecological intervention, patients should be kept under medical observation for the ensuing twelve to twenty four hours It should not be made during a febrile period, and the absence of painful reactions in the small pelvis should be verified by palpation Patients should be given, as in the case of curetting, an antiseptic vaginal [illegible]ction, preferably iodized The apparatus should be [illegible]erful, since radiographs in profile, taken with a Potter [illegible]ky machine, are indispensable, and the injection must be controlled by radioscopy Since it is necessary to fill the uterine and tubal cavities with the opaque injection, and as these organs contract, two conditions are necessary a complete obturation (both at the isthmus and external orifice) of the cervix, and a sufficient but limited pressure Methods of obtaining the former are described The pressure, ascertained by a hystero manometer, should not exceed 30 cm of mercury A preliminary radioscopical examination is indispensable to ascertain if the cervical obturation is good, to control the normal filling of the cavities, and to study the uterine and tubal contractions The radiographs should be made both in full face and in profile, two successive ones, taken at short intervals, will prove useful In order to study the permeability of the tubes, radiographs must also be taken twenty four hours after the injection In diagnosing pelvic tumours it is necessary to know the relation of the growth to the uterine cavity Though by pneumo peritoneum a very exact general picture of the tumour can be obtained, the dangers and inconveniences of this method are well known, a simpler and perfectly safe procedure is therefore described by the author A method of obtaining stereoscopic pictures is also indicated, these are always very instructive, and can be taken without special instrumentation

Pathology.

69 Chemistry and Physics of the Blood

C VAN CAULAERT (*Presse Méd*, May, 1930, p 601), who has reviewed the work of Henderson, Haldane, Van Slyke, and others, regards the blood as being a physico chemical system composed of interdependent variables whose interrela tions obey definite laws, which can be expressed by formulae and are applicable to pathological conditions Raising the partial pressure of CO_2, or lowering the *p*H by passing this gas through the blood, causes an increase in the amount of bases in the serum and a diminution in the amount of bases in the corpuscles, but increases the water content and therefore the volume of the cells, with a corresponding diminution of the water and volume of the plasma, there is also an increase in the amount of the corpuscular chlorides and a diminution of the chlorides in the plasma The distribution of water, chlorides, and bicarbonate between plasma and corpuscles is a function of the CO_2 pressure in the blood The osmotic pressure of the intracorpuscular fluid is equal to the osmotic pressure of the plasma In the corpuscles and plasma the positive charges of alkaline kations are compensated by charges of negative anions composed of non diffusible proteins, and diffusible anions of chlorides and bicarbonates, the chief ions concerned in the osmotic pressure of the blood are monovalent K, Na, and HCO_3 Of the blood proteins, haemoglobin alone influences the osmotic pressure The blood proteins in an alkaline medium behave as acids in respect to their isoelectric point By dialysing the proteins and bases through a collodion sac, progressively lowering the *p*H, and measuring the amount of the bases that had passed through the membrane, Van Slyke demonstrated that the amounts of fixed bases increased directly as the *p*H of the plasma was raised, the amount of the bases fixed to the corpuscular protein—haemoglobin—is much greater than the amount of the bases fixed to the proteins of the serum

70 Experimental Tests with an Antituberculosis Serum

W A KUTEISCHIKOW (*Zeit f Immunitätsforsch*, May 2nd, 1930, p 261) prepared an antituberculosis serum by the injection of a horse with increasing doses of a living but comparatively avirulent culture of the human type of tubercle bacillus The strain had been submitted to thirteen successive subcultures on a medium containing a low concentration (probably about 1 in 8,000) of trypaflavine At the end of this treatment one fifth of a potato culture gave rise in guinea pigs, inoculated subcutaneously, to a chronic non fatal infection confined almost exclusively to the lymph glands and accompanied by sclerosis The horse was injected over a period of eight months, and was then bled A preliminary experiment made on a small number of guinea pigs suggested that the serum had curative properties A larger experiment was therefore devised on the following lines Batches S1, S2, and N, each containing twenty guinea pigs, were inoculated subcutaneously in the thigh with 1 mg of virulent tubercle bacilli Ten days later serum injections were commenced S1 was treated daily for eight months, and S2 for five months, with the specific serum, N was treated for six to eight months with normal horse serum Batch S3 of twenty guinea pigs was infected with 20 mg and received specific serum treatment Batch K of ten animals was infected with 1 mg and received no serum treatment The results were very suggestive The animals in the control batch K and the heavily infected batch S3 died of general tuberculosis in four months During the first four months the animals in batches S1, S2, and N increased in weight, batch N then showed symptoms of illness, and by the end of the eighth month only one animal survived, for 15 had died of general tuberculosis, 3 had been killed for examination, and one had died from other causes Of the specifically treated batches S1 and S2, not a single animal had died of tuberculosis at the end of eight months, four animals in S1 died of other causes, and two were killed, in S2 four were killed The experiment is being continued, but the author considers that the results are so far sufficiently striking to ascribe an undoubtedly curative effect to the specific serum

A safe and simple antacid which is also a gentle laxative must necessarily be of great value to medical practitioners when administering to ladies and children and all who are constitutionally delicate
May we, therefore, venture to remind you of

DINNEFORD'S
PURE FLUID MAGNESIA

which has been extensively prescribed and used by the Medical Profession for a Century and is still the best and safest means of administering Magnesia.

When prescribed for the nursery too, Dinneford's Magnesia has always proved immensely useful as a corrective, and when mixed with infant's food it prevents many of the troubles which are due to acidity flatulence, etc.

We are confident that you will find in Dinneford's Fluid Magnesia a reliable and safe solution which may be freely used for many ailments, and we would request your kind consideration of its use as occasion offers

Dinneford's Pure Fluid Magnesia possesses antacid and laxative qualities which are incomparably better than those of any of the various preparations of Magnesia, in powder, now being introduced.
It cannot harm the most delicate constitution and is at all times a safe and effective laxative.
Manufactured in London for the past 100 years

THE TREATMENT OF RHEUMATOID ARTHRITIS

THIS disease which the medical man is increasingly called upon to combat may be successfully treated by the correct application of Pistany radio active Mud Packs

The packs can be applied in the patient's own home if necessary and the treatment may be successfully combined with other physiotherapeutic methods.

Pistany (Czecho Slovakia) offers the most effective treatment for the cure of rheumatoid arthritis. The properties of Pistany's hot volcanic soft mud are quite peculiar During the season over 26 000 visitors go to this picturesque Spa and statistics show that of 100% of patients only less than 5 do not respond to the treatment—30 are completely relieved and 65% are considerably improved

Home treatment can never supersede the cure at the Spa

1930 A No 028

IN THE HIGH COURT OF JUSTICE
CHANCERY DIVISION
MR. JUSTICE BENNETT

IN THE MATTER OF APNEUGENE LIMITED
and
IN THE MATTER OF THE COMPANIES ACT 1929

NOTICE IS HEREBY GIVEN that a Petition was on th 27th day of May 1930 presented to His Majesty's High Court of Justice by the above named Company to confirm an alteration of the said Company's objects proposed to be effected by a Special Resolution of the Company duly passed in accordance with S 5 of the Companies Act 1929 at an Extraordinary General Meeting of the said Company held on th 22nd day of April 1930 and which Resolution runs as follows —

That the objects of the Company as set forth in clause 3 of the Memorandum of Association of the Company dated the 6th day of May 1924 be altered and/or extended as follows—i.e. That paragraph (b) to (J) inclusive be deleted and that the following paragraphs be substituted therefor

(b) To so conduct the same and the Company's business generally

(I) That the activities of the Company shall be governed by the Ethics of the Medical Profession and that the Company shall have no power to advertise otherwise than in the recognized publications of the Medical Profession nor to do any acts or things either directly or indirectly such as might render any registered Medical Practitioner associated with the Company liable to be struck off the *Medical Register* or to the censure of the General Medical Council as set forth in the Warning Notices issued by that Council.

(II) That any medical treatment provided by the Company shall be at all times rendered under the immediate and direct supervision and control of a registered Medical Practitioner who shall at all times be fully responsible therefor

"(III) That the relations between any registered Medical Practitioners associated with the Company and registered Medical Practitioners in private practice shall at all times conform to the usual Ethical procedure prevailing between consultant and private practitioners."

AND NOTICE IS FURTHER GIVEN that the said Petition is directed to be heard before the Honourable Mr Justice Eve at the Royal Courts of Justice Strand London on Tuesday the 29th day of July 1930 and any person interested in the said Company whether as creditor or otherwise desirous to oppose the making of an order for the confirmation of the said alteration under the above Act should appear at the time of the hearing by him or his Counsel, for the purpose, and is required to give two clear days previous notice in writing of his intention to appear with grounds of his objection to the undersigned the Solicitors for the said Company A copy of the said Petition will be furnished to any such person requiring the same by the undersigned on payment of the regulated charge for the same

INDIAN MEDICAL SERVICE

Recruitment of European Officers.

Applications are invited from medical men for permanent commissions in H M's Indian Medical Service The terms offered include a gratuity of £1,000 on retirement after six years' service, or £2,500 after 12 years' service, together with free return passages, for those who no longer desire to remain in the Service In other respects the terms will be as detailed below

Candidates must be British subjects under 32 years of age at the time of application, and must be registered under the Medical Acts in force in Great Britain and Northern Ireland

CAREERS

The Indian Medical Service offers wide opportunities of medical experience, including clinical, preventive, specialist, and research work At the beginning of his career an officer is employed on the military side, which has medical charge of the Indian Army Promotion is on a time scale up to the rank of Lieutenant-Colonel, and by selection to the ranks of Colonel and Major-General An officer may apply after two years' Indian service to have his name registered for transfer to the civil side, from which appointments are made to Civil Surgeoncies, which are established at the principal civil centres to provide for the medical needs of civil officials and for general medical administrative purposes, to specialist (for example, public health and bacteriological) services, to research posts, and to professorships at the Medical Schools

PAY

The monthly rates of pay for European officers in the Service who have a "non-Asiatic" domicile are as follows

Rank	Service in Rank.	Basic Pay	Overseas Pay	Year of Total Service
1	2	3	4	5
		Rs	Rs	
			150	1st
Lieut		500	150	2nd
			150	3rd
			150	4th
Capt.	(i) During first 3 years service as Captain	650	£15	5th
			£15	6th
			£25	7th
	(ii) With more than 3 and less than 6 yrs service as Captain	750	£25	8th
			£25	9th
			£25	10th
	(iii) With more than 6 years service as Captain	850	£25	11th
			£30	12th
Major	(i) During first 3 years service as Major	900		
	(ii) With more than 3 and less than 6 years service as Major	1100		
	(iii) With more than 6 years service as Major	1250		
Lieut Col	(i) Until completion of 23 years total service	1500	£30	13th and over
	(ii) During 24th and 25th years service	1600		
	(iii) After completion of 25 years total service	1700		
	(iv) When selected for increased pay	1850		

EXTRAS.—In addition to the above rates various allowances are admissible for a large number of special appointments on both the military and the civil side which may be held by members of the Indian Medical Service Special high rates of pay are also attached to the numerous administrative appointments open to officers in both branches of the Service

ANTEDATES IN COMMISSION

Any service rendered by an officer during the war as a medical or combatant officer, or in a position usually filled by an officer, may be counted as service for increments of pay promotion retirement and retired pay, but not for gratuity

One half of any service in the ranks during the war may be counted as service for retirement and retired pay only

Candidates possessing certain higher medical qualifications may be granted an antedate of one year in their commissions Past service in certain hospital appointments may also render candidates eligible for an antedate of one year Persons holding or about to hold resident posts at recognized hospitals may be seconded in those posts for a period not exceeding one year The maximum period of antedate, secondment or antedate and secondment combined, admissible under this paragraph, is limited to one year

OUTFIT ALLOWANCE

Officers on appointment will receive an outfit allowance of £50

PRIVATE PRACTICE

With the exception of Administrative Officers, military or civil, and officers holding certain special appointments, officers are not debarred from taking private practice, so long as it does not interfere with their proper duties

PENSIONS.

The rates of pension are as follows	Per annum.
	£
After 17 years' service for pension	400
,, 18 ,, ,, ,,	430
,, 19 ,, ,, ,,	460
,, 20 ,, ,, ,,	500
,, 21 ,, ,, ,,	540
,, 22 ,, ,, ,,	580
,, 23 ,, ,, ,,	620
,, 24 ,, ,, ,,	660
,, 25 ,, ,, ,,	700
,, 26 ,, ,, ,,	750
,, 27 ,, ,, ,,	800

These rates are subject to alteration on account of a rise or fall in the cost of living as compared with the year 1919 to an extent not exceeding 20 per cent in all the revision being undertaken triennially With effect from July 1st, 1927, a reduction of 4½ per cent has been made on this account from the amounts shown

There are additional pensions ranging from £65 to £350 per annum for officers who have held administrative appointments

PASSAGES

An officer on appointment is provided with a free passage to India The wives and families of officers who are married prior to the date of the officers embarkation on first appointment will also be provided with free passage to India, subject to the payment of messing charges

Officers and their families are also eligible for passage concessions under which they are granted a certain number of return passages home at Government expense during their service

INSTRUCTION PRIOR TO EMBARKATION

Officers are required to undergo courses of instruction at the Royal Army Medical College and at Aldershot, lasting approximately six months prior to their embarkation for India on first appointment

Full details regarding these appointments and forms of application may be obtained from the Under-Secretary of State for India, Military Department, India Office, London, S W 1 The Selection Committee will meet at the India Office in July, and the selected candidates will be required to join a course of instruction commencing early in August, 1930 Applications should be submitted as soon as possible

EAST AFRICAN MEDICAL SERVICE.

VACANCIES at present exist for MEDICAL OFFICERS in the EAST AFRICAN MEDICAL SERVICE

Qualifications—Candidates must be British subjects of European parentage and under 35 years of age They must possess a double qualification and be on the British Medical Register Preference will be given to candidates who have held Hospital or Public Health appointments or who have special knowledge of anaesthetics radiology surgery medicine ophthalmology, gynaecology and midwifery, diseases of the ear nose and throat, venereal diseases etc

Salary—£600 per annum rising by annual increments of £30 to £840 per annum and thence subject to an efficiency bar, by £40 to £920 per annum

Quarters—Free quarters are provided or an allowance is given in lieu

Passages—Free first-class passages are provided both on first appointment and when proceeding on or returning from leave A married officer will be granted an allowance towards the cost of his family s passage once each way in respect of each tour of service

Terms of Appointment—The appointments are pensionable subject to a probationary period of two years in the first instance

Length of Tour of Service—The normal tour of service is 20 to 30 months after which leave is granted, with full salary for 2½ to 3½ days according to the districts in which the officer has served, for each month of service plus the period of the voyage to England If the officer is returning to East Africa for further service he receives a further similar amount of leave plus the period of the voyage to East Africa

Course of Instruction in Tropical Medicine—Selected candidates will normally be required to undergo a course of instruction in Tropical Medicine and Hygiene before proceeding overseas

Duties—Though Medical Officers are appointed in the first instance for general service there are good opportunities for work in special branches of medicine and surgery and for research

Further particulars and forms of application may be obtained on application in writing, from the Private Secretary (Appointments) Colonial Office, 2 Richmond Terrace Whitehall, London, S W 1

County Borough of Doncaster

IN CONSTIPATION

Try this Tonic Laxative

AGAROL

BRAND COMPOUND

the original mineral oil emulsion with phenolphthalein, not only softens the intestinal contents but *gently stimulates* the peristaltic action and thereby aids in re-establishing normal bowel function.

We will gladly send you a liberal quantity to convince you of its merits

FRANCIS NEWBERY & SONS, LTD.,

HORMOTONE
BRAND

in disorders of the

CATAMENIA

and the

MENOPAUSE

Hormotone supplies the physiological stimulus to the endocrine glands, whose functional activity determines the normal catamenial flow

When these internal secretions begin to fail at the period of the menopause, Hormotone acts both by substitution and homostimulation

Dose One or two tablets three times daily

REGULARITY AND COMPLETENESS OF BOWEL EVACUATION

HOW TO ENSURE BOTH

Attention has recently been drawn to the incompleteness of evacuation common even among those who complacently boast of their regularity

Completeness as a distinguished physician said the other day is even more important than regularity in the exercise of this physiological function Incomplete evacuation doubtless explains why so many people with regular once a day habits continue to suffer from headache lassitude nausea and all those other symptoms customarily attributed to alimentary toxaemia The truth is that in these individuals the rectal neuromuscular tension scarcely ever recovers normality

These discomforts and disabilities can generally be made rapidly to disappear by a minimal effective dose of Eno s Fruit Salt taken each morning before the early cup of tea Eno is a carefully prepared saline laxative of fine granular consistency instantly soluble in water with effervescence It is entirely free from the nauseous and irritating mineral salts Its pleasant taste and refreshing character are due to its chemical purity and physical texture Another of its advantages is that it contains no sugar or artificial flavouring agent

"The Doctor's Emergency Reminder"

The Proprietors of ENO s Fruit Salt will deem it a privilege to send to any member of the Medical Profession a copy of the latest of their series of Medical Reminders —with or without a little of their preparation as desired The Doctor s Emergency Reminder summarises briefly a few points in connection with the treatment of poisoning and various other emergency cases It is bound in black morocco limp to conform to the style of the previous publications in this series.

ENO'S "FRUIT SALT"

Valentine's Meat-Juice

In **Typhoid Fever, Diarrhoea and Cholera Infantum,** when it is **Essential** to **Sustain** the patient **without irritating** the **Digestive Organs,** the **Ease** of **Assimilation** and **Power** of **Valentine's Meat-Juice** to **Restore** and **Strengthen** has been demonstrated in Hospital and Private Practice.

THE quickness and power with which VALENTINE'S MEAT-JUICE acts, the manner in which it adapts itself to and quiets the irritable stomach, its agreeable taste, ease of administration and entire assimilation recommend it to physician and patient

Physicians are invited to send for brochures containing clinical reports.

For sale by European and American Chemists and Druggists

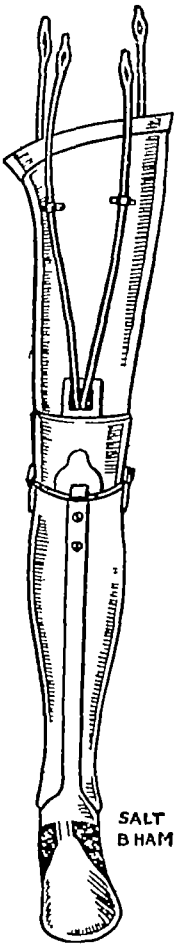
Five Essentials of an Artificial Leg



Comfort
is naturally the first consideration

Lightness
reduces the physical strain to a minimum

Action
governs rapidity of movement and natural gait

Appearance
is maintained when made to match the fellow limb

Simplicity
in construction lessens cost and maintenance

SALT'S LIGHT METAL LIMB FOR ABOVE KNEE AMPUTATION

The above illustration shows one of our many artificial legs When fitted by us they possess the above FIVE essentials

Made of duralumin with wooden foot, it weighs only 3½ lbs for an adult male patient

We manufacture wooden, leather, and metal limbs for ALL types of amputation, and can send expert fitters to any part of the country

Illustrated Lists sent on request.

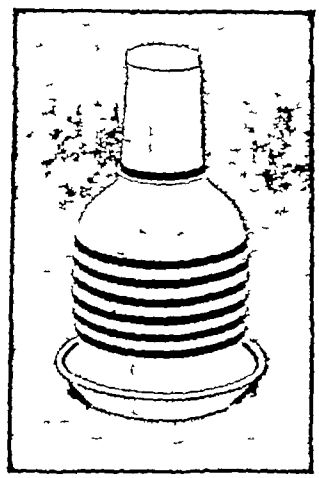
LEIGH PLACE, BROOKE STREET, HOLBORN, LONDON, E.C.1

Showrooms: 14 BALDWIN'S GARDENS—adjoining



A new invention for sterilising water and making it germicidal

demanding your interest and co-operation

A steriliser that quickly creates germ-free water without affecting the colour, taste or smell

The value of sterile water is obvious to everyone in the Medical Profession An apparatus that will sterilise highly infected water without care or attention, and make that water germicidal so that it resists any chance of further infection certainly fulfils a long felt need To those interested in the restriction of infection spread through micro-organisms present in ordinary water, the discovery of a new and efficient method of sterilisation comes as important news

The inventor is a Munich Physicist, Dr G A Kruse

10½ high and 7½ wide Total contents one quart Summary of reports 1 The steriliser is capable of killing off 5 to 6 million bacteria as found in drinking water in very high concentrations 2 The treated water has itself bactericidal properties

Some £40,000 has already been expended to establish the practicability of the invention, which has been styled Catadyn on account of its dual catalytic and dynamic action The basis of Catadyn is silver in a new highly active state, which quickly sterilises water without affecting its physical properties

The British Catadyn Co , Ltd., has no hesitation in seeking your co-operation in the introduction of this new steriliser which will treat up to 250,000 gallons of water without renewal.

A complete steriliser as illustrated above will be sent without charge to Members of the Medical Profession for Clinical (or Domestic) trial or can be purchased for £2 from the address below A convenient type packed in Monel Metal Container is available at £2 2s

COLITIS IN CHILDREN

The Dysentery Bacillus as a common factor

An extract from an article under this heading in the "Practitioner," July, 1930, p 75, is as follows —

TREATMENT —The chief aim is to provide a diet favourable to bringing about an alteration in the intestinal flora

For this purpose certain carbohydrates are indicated by reason of the properties they are stated to possess in promoting the growth of such organisms as the Bacillus acidophilus and Bacillus bifidus These Bacteria tend to produce an acid reaction of the intestinal contents which is unfavourable to the growth of the dysentery organisms

Lacto-Dextrin two or four heaped teaspoons three to four times a day in milk or water, we think is definitely of value, from our experience in the treatment of these cases

Samples and literature will be sent on request to the Medical Profession on application to Sole Distributing Agents for United Kingdom and Irish Free State COATES & COOPER, 41, Great Tower Street, London, E C.3

STANIFORM
Regd. BRAND Trade Mark.
METHYL STANNIC IODIDE

OINTMENT
Immediately stops the pain in all cases of burns scalds etc.

DUSTING POWDER
For application where a greasy substance is counter indicated

LINIMENT
Remarkably effective in treatment of Rheumatoid Arthritis

LOTION
A panacea for Mosquito and other insect bites Most effective for all purposes where Tr Iodine is employed Does not stain the skin and there is no sting

TABLETS
Staniform being an organic compound is more easily assimilated than the Tin preparations at present in use

Supplies may be obtained through the Wholesale Druggists Druggists Sundriesmen or Dental Supply Companies

What the Profession says

The following are some recent unsolicited testimonials reported to the Manufacturers by Medical Men

I continue to get every satisfaction from Staniform in the case of carbuncles boils whitlows and all kinds of infected wounds."

In a case of acute eczema on leg the skin was quite normal within one week after starting application of Staniform Ointment "

Festering wound on left heel when first seen was about the size of a shilling with good deal of pus For much swollen—dressed with Staniform Ointment healed splendidly in four days

Similar testimony has been received from a large number of medical men when "Staniform" has been used for the treatment of Burns Wounds and Skin Ailments

STANIFORM is used in Leading Hospitals.

STANIFORM over a wide field of clinical experience has exhibited positive curative properties. Combining the well known usefulness of Tin in staphylococcic infections with the powerful germicidal properties of Iodine Staniform is indicated generally in local inflammations inducing an immediate soothing effect with rapid healing

"BYNO" HÆMOGLOBIN

A Powerful Hæmatinic and Tonic

Presents the hæmoglobin, proteins and salts of fresh blood in combination with "Bynin," Liquid Malt The hæmoglobin is prepared by a special process which conserves its physical properties and prevents decomposition, an important point since decomposition is accompanied by loss of therapeutic properties

Advantages of "Byno" Hæmoglobin over inorganic iron preparations are its rapid absorption, greater hæmatopoietic effect, and its freedom from gastro-intestinal disturbances

Indicated as a routine treatment in simple anæmias, in general debility and in convalescence Clinical trial samples and literature will be gladly sent on request

OVALTINE

HURA-PA-KHART—*wearing the Double Crown*

FOR HEALTHY NUTRITION.

In every condition in which the need of a nutritious and easily digested food is indicated the advantages of "Ovaltine" are definite and many In no case need the physician hesitate to order its liberal use

"Ovaltine" is a highly concentrated extraction of malt, milk, and eggs It is almost completely absorbed by the system, and because of its complete absorption, and because it is a form of nourishment complete in every respect, "Ovaltine tones, strengthens, reinforces, and reinvigorates the whole body

"Ovaltine" is purin-free Its use neither aggravates the tendency to arterio-sclerosis nor favours the accumulation of uric acid in the system This delicious food beverage sustains life ideally by promoting the healthy activity of the bodily functions

A liberal supply for clinical trial sent free on request

INFANTILE DIARRHOEA

In cases of wasting disorders of early infancy so prevalent at this time of the year a diet of Mellin's Food in conjunction with cow's milk and water has been found to produce a quicker gain in weight than any other artificial diet.

By the use of

Mellin's Food

for infant feeding these two distinct advantages are secured—

1. There is much less danger of producing digestive disturbances for Mellin's Food is well tolerated and easily and rapidly assimilated.
2. Where conditions of diarrhoea have been produced by the use of other sugars the dextro-maltose in Mellin's Food brings the diarrhoea under immediate control

Further particulars and samples will be supplied on request

MELLIN'S FOOD LTD LONDON S.E.15

"MODIFIED MILK IN INFANT FEEDING"

The above-named booklet of 64 pages will be gladly sent to members of the Medical Profession

Regesan

CREAM OF MAGNESIA with LIQUID PARAFFIN

(Contains 30% Liquid Paraffin)

A stable well balanced combination containing 30% Liquid Paraffin held in suspension in a finely divided state. Its consistency is such that the tendency to leak exhibited by Liquid Paraffin is eliminated.

Regesan Cream of Magnesia with Liquid Paraffin provides suitable treatment for all digestive troubles with which constipation and hæmorrhoids are associated. It is certainly the ideal laxative during pregnancy and lactation and most suitable for infants and children.

Price 1/6 per bottle.

Full-size trial package free to Medical Practitioners in the British Isles on application to Boots the Chemists, Station Street, Nottingham.

Sepsis

Until recently no antiseptic has been available for the treatment of sepsis which not only possesses adequate germicidal power, but can be applied in effective dilutions without damage to tissues

Monsol has a germicidal action on the STREPTOCOCCUS PYOGENES more than ten times greater than that of pure phenol or lysol, and can be applied in dilutions stronger than those found capable of killing this organism, even to mucous membranes

The following are some of the conditions in which this property can be utilised

THROAT INFECTIONS
As a gargle in streptococcal tonsillitis for the treatment of streptococcus carriers in scarlet fever outbreaks

SKIN CONDITIONS
As an ointment or lotion in impetigo and other forms of dermatitis, for boils and carbuncles

WOUNDS AND ABRASIONS
As an immediate prophylactic application, or as a dressing for injuries already septic

OBSTETRICAL PRACTICE
As a vaginal or intra uterine douche

DENTAL SEPSIS
As a mouth-wash after extractions

Monsol Liquid for dressings, douches, packs, and all sick room purposes

Monsol Capsules keratin coated, for intestinal disinfection

Monsol Ointment and *Monsol Throat Pastilles*

0 30 gm 0 45 gm
0 60 gm

Supplied in single ampoules or in boxes of ten ampoules

Invaluable as a Galactagogue

This nourishing and sustaining food drink is helpful to nursing or expectant mothers

NOT only hundreds, but literally thousands of cases are recorded in which this well-known preparation — Horlick's Malted Milk — has proved its efficiency as a body-building food

It is particularly valuable as an addition to the diet of the expectant and nursing mother For Horlick's is a perfectly balanced food containing fat, proteins and soluble carbohydrates combined together in correct nutritive ratio It is prepared from fresh, full-cream cows' milk, selected wheat and malted barley — and, during manufacture, is partially predigested to ensure easy assimilation

Horlick's is rich in valuable malt-sugars, but contains neither cane sugar nor free starch It is therefore extremely easily digested, and highly productive of energy

These characteristics make it valuable as a galactagogue Its abundant nutriment supplements any deficiencies in the mother's regular diet, and promotes a regular and nourishing supply of milk, and its easy digestibility makes it acceptable when other forms of nourishment are unwelcome.

Taken during pregnancy, it builds up the mother and helps to maintain her vitality A cupful taken regularly first thing in the morning frequently abolishes and almost invariably alleviates the discomfort of morning sickness

Horlick's is now obtainable in two forms — the original, natural-flavoured Malted Milk, and the new Chocolate Flavoured form — identical in its constituents with the original Horlick's, but flavoured with fine chocolate Horlick's is sold in sealed glass bottles, price 2/-, 3/6, 8/6, 15/- Also in tablet form

Further details may be obtained from Horlick's Malted Milk Co, Ltd, Slough, Bucks

HOW GIBBS HELPS THE DOCTOR

The Scope of Gibbs Educational Work

The educational work carried on by Gibbs is of tremendous value to the Doctor By means of this highly organised effort a very large section of the public is reached during the most impressionable age – childhood. They are taught a great deal about their teeth—their construction and how Nature builds them—how they are finally formed—and the best way to preserve them in all their natural beauty

Not only is this of great value in impressing upon the children the vital need that great care should be taken of the teeth, but this educational background is a useful field in which the Doctor may plant his special advice or instructions More intelligent heed is given his words. Gibbs educational programme includes —

IVORY CASTLE LEAGUE AND CRUSADE

The primary object of the League is to put into the hands of all who are interested in the promotion of Oral Hygiene the means of interesting the rising generation in their own welfare.

Membership of the League is open to all bona fide Teachers and accredited persons interested in the state of Children's teeth. Crusaders are enrolled by their teacher

BOOKS AND CHARTS

For the Juniors, Fairy Books are provided. For Seniors, the booklet, "My teeth and how to defend them."

A set of eight Charts has been prepared illustrating the Formation, Structure and Care of the Teeth.

TOOTH BRUSH SCHEME, FILM AND SLIDES

To establish the Tooth Brush Habit the House of Gibbs will supply at nominal cost SETS consisting of one Tooth Brush and tin of Dentifrice.

Four sets of slides with a lecture on Dental Hygiene, and/or a fascinating fairy film free on loan.

GIBBS DENTURE TABLET

Gibbs new Denture Tablet is for cleaning Dental Plates Bridgework (both gold and vulcanite) and artificial teeth. It gives a high polish, removes stains makes plate or teeth sterile and antiseptic without in any way injuring the softest gold or the finest vulcanite or platinum. The formula has been submitted to and approved by important members of the Medical Profession.

OBSERVATION AND EXPERIMENT AND THEIR USE IN THE MEDICAL SCIENCES

BY

WILFRED TROTTER, M.S., M.D., F.R.C.S.,

SURGEON TO UNIVERSITY COLLEGE HOSPITAL

THE METHODS OF SCIENCE IN GENERAL

THE accumulation of verifiable knowledge, which is the object of science, depends fundamentally on the discovery of invariable sequences of events in the complex and apparently random phenomena of our experience. The obvious method of doing this is that of observation. We study the natural succession of events as they pass before us and observe those resemblances and recurrences which betray an underlying relation. The power of the method has been increased by refinement and elaboration until it can scarcely be recognized in this simple statement of it. Instruments such as the telescope, the microscope, the spectroscope, have increased its range and its precision, completeness and exactitude of record have increased its trustworthiness, and mathematics has given it the power of detecting relations among recorded facts too complex or too obscure to be within range of direct contemplation. But refinement of method, however far it may be carried, can never surmount the limitation by which observation in its very nature is restricted. This limitation is the circumstance that the observer must wait upon the natural occurrence of the phenomena he wishes to study. The phenomena may be too infrequent for their significant recurrence to come within the span of human life, they may be too complex, and too closely mixed with irrelevant events for the invariable sequences they possess to be detected.

Science has found a means of escape from the limitations of the method of observation in the method of experiment. Partial as the solution of the problem must be admitted to be it has proved of the highest value—of such value, indeed, that its own limitations tend sometimes to be a little overlooked. It will therefore perhaps be useful to examine more closely the relations of the two methods.

The method of experiment seeks to free the man of science from the arbitrary natural distribution of the phenomena he wishes to study. It seeks to give him the required phenomena at command and unmixed with irrelevant events which may modify the essential facts and confuse the study of them. Experiment, then, isolates the event to be studied from the common order of nature, and causes it to occur in circumstances as far as possible simplified and subject to specification.

Applicability of Experiment

Certain sciences have not merely benefited by experiment, but have been created by it. This is true of physics and of chemistry, and is so nearly true of physiology as scarcely to need discussion. In all these sciences experience has proved that the laboratory "event" is as good as the natural 'event,' and that the simplification needed for experimental precision is not necessarily accompanied by distortion of the phenomena concerned. On the whole perhaps it is surprising that physiology has been able successfully to isolate for study so many of the phenomena of living organisms, but of the fact there can be no doubt.

Regarded as subjects for experiment certain sciences stand at the opposite extreme to the position occupied by chemistry and physics. Such are astronomy, geology, meteorology. In the material of their sciences the scale of time and space and the forces concerned are so large that it is usually impossible to produce in the laboratory conditions approaching those of the natural event. These sciences therefore must be, and apparently must continue to be, primarily observational. This is however, by no means to deny that they can and do have useful relations with experimental methods though these relations may be less direct than in other sciences. In geology we may, for example, study in the laboratory some of the elements in the process of metamorphism though we can command no more than an almost negligible fraction of the time and the force that have gone to the formation of metamorphic rocks in nature. In meteorology, again we may study the differences of electric potential that are produced by the breaking up of falling water drops but we must remain almost infinitely far from the scale and magnitude of a natural thunderstorm. In astronomy a science of whose debt to experimental work there can also be no question the impossibility of reproducing in the laboratory the conditions of the natural event is still more apparent.

Thus in geology, meteorology, and astronomy experiment occupies the position of the small scale model and is therefore subject in its degree to the defects of the argument from analogy. These sciences must in fact be described as sciences of *observation and collateral* experiment and have very plain methodical differences from the sciences of *direct* experiment such as physics and chemistry.

Experiment in the Biological Sciences

Physiology has been included here among the sciences of direct experiment, and there can be no doubt of the thoroughness and success with which it has established itself there. It has been hinted however, that the case of physiology is to some extent different from that of the other sciences of direct experiment and its brilliant evolution has had to overcome difficulties special to it. The living organism has a certain perhaps indefinable but not the less substantial unity, and it is this unit and not its constituent parts or processes that has been the material acted on by evolutionary forces. A physiological process may therefore be expected to lose something of its full natural character when it is isolated from the complete animal for purposes of experimental study. This consideration does in fact express one of the limitations of experimental physiology and one that is apt to become increasingly manifest in the most advanced branches of the subject. On the whole however, it is highly remarkable with what success the physiologist has been able to defy this limitation and to detach bodily processes into circumstances of such simplification, or such complete specification, as to make study fruitful without unduly distorting their natural character. Such classical simplifications as the nerve muscle preparation, the isolated heart, the spinal animal, have been justified beyond all question by the substantial additions to knowledge that have been made through them. These preparations cannot, however, fail to remind us sharply of the difference in the status of experiment in physiology and in physics and chemistry. The essence of a scientific experiment is the specification of its conditions. Nor the least medium of any bodily organism is the intact living animal and its normal activity is closely compounded with that of the whole organism. In drawing conclusions from the behaviour of a physiological preparation it is necessary therefore, to specify how far it has been modified by being isolated. The difficulty of doing this with fullness and precision is not inconsiderable—even the necessity for it is not always closely attended to—and does undoubtedly counterbalance to some extent the advantages of simplification that the experimental method possesses. When this lack of specification is least surmountable we can see in physiology a tendency to become a science of collateral rather than of direct experiment.

Scientific Method in Human Biology

The distribution of method in the sciences not concerned with the life of man is relatively simple, because all the larger deciding factors are entirely beyond human influence or control. With the sciences of human life,* the

* The interrelation of physiology and pathology is so close that from the point of view of method they may be usefully regarded as continuous and inseparable. The apparent necessity for the medical student to complete his knowledge of the normal before beginning his study of the abnormal is probably as fallacious as it is practically wasteful and inconvenient.

of the circulation should arouse the most cautious posture should arouse the most cautious results of animal experiment

Longevity—The fact that man survival to an age long past that of reproduction is a common event makes his general biological position in some ways unique. Morbid states that show themselves on the whole only when reproductive activity is normally waning or at an end can have a selective elimination acting against them, they can thus flourish untouched by what is probably the strongest of all checks upon disease that normally have their range in or before the active period of sexual life. It seems reasonable to suppose that an essential factor in the inveteracy of cancer and its excessive frequency in man is its existence in what we may call a biological backwater, where it has no effects of election to contend with. The difference in frequency of sarcoma and carcinoma might perhaps plausibly be accounted for in the same way. In applying the results of animal experiment to pathological conditions it is [illegible] that this peculiar feature in the [illegible] the latter may be a cause of difficulty, and [illegible]

Deficiency of Vitamin in Food Supply—It is well [illegible] and in a general way the [illegible] of the diet. It is indeed the emptiness of the

appreciate the inestimable gifts [illegible] biology has got, and will probably continue to get, from collateral experiment, yet do suggest that for the finest and deepest insight into the most characteristic phenomena of man's life it will be necessary to use, with all its inherent restrictions, the method of direct experiment in man himself.

Our knowledge of normal physiology in man, such as it is, is almost wholly due to the experimental method. In the study of disease, on the other hand, while the experimental method has been very valuable, and promises to be increasingly so, it is to be noted that the method of observation has behind it a long and honourable history, but it cannot be denied that for a considerable time essential progress in our knowledge of disease has come less and less from the time-honoured method of observation and more and more from experiment. Moreover, with all its opportunities, observation has at its best been able to disclose but little of the fundamental processes of disease, of the exact meaning of morbid phenomena, or of the precise mechanism lying behind symptoms, whereas experiment has a remarkable series of successes of these very kinds already to its credit. In view of such considerations as these it may well be asked

OBSERVATION AND EXPERIMENT AND THEIR USE IN THE MEDICAL SCIENCES

BY

WILFRED TROTTER, M.S., M.D., F.R.C.S.,

SURGEON TO UNIVERSITY COLLEGE HOSPITAL

THE METHODS OF SCIENCE IN GENERAL

THE accumulation of verifiable knowledge, which is the object of science, depends fundamentally on the discovery of invariable sequences of events in the complex and apparently random phenomena of our experience. The obvious method of doing this is that of *observation*. We study the natural succession of events as they pass before us and observe those resemblances and recurrences which betray an underlying relation. The power of the method has been increased by refinement and elaboration until it can scarcely be recognized in this simple statement of it. Instruments such as the telescope, the microscope, the spectroscope, have increased its range and its precision; completeness and exactitude of record have increased its trustworthiness, and mathematics has given it the power of detecting relations among recorded facts too complex or too obscure to be within range of direct contemplation. But refinement of method, however far it may be carried, can never surmount the limitation by which observation in its very *nature* is restricted. This limitation is the circumstance that the observer must wait upon the natural occurrence of the phenomena he wishes to study. The phenomena may be *too infrequent for their significant* recurrence to come within the span of human life, they may be too complex, and too closely mixed with irrelevant events for the invariable sequences they possess to be detected.

Science has found a means of escape from the limitations of the method of observation in the method of *experiment*. Partial as the solution of the problem must be admitted to be it has proved of the highest value—of such value indeed, that its own limitations tend sometimes to be a little overlooked. It will therefore perhaps be useful to examine more closely the relations of the two methods.

The method of experiment seeks to free the man of science from the arbitrary natural distribution of the phenomena he wishes to study. It seeks to *give him the required* phenomena at command and unmixed with irrelevant events which may modify the essential facts and confuse the study of them. Experiment, then, isolates the event to be studied from the common order of nature, and causes it to occur in circumstances as far as possible simplified and subject to specification.

[illegible] very variable, so that the sig[illegible] being looked for may present itself in a different disguise of detail at each reappearance. The simple method of establishing the significance of a group of phenomena by the dry statistical record of its invariable recurrence in given circumstances is thus not widely applicable in medicine, and the method of observation has not usually obtained its more considerable advances in this way. More often the observer has to be content with a limited number of recurrences of the group of phenomena, and relies upon his close familiarity with and "feeling" for his material to confirm the relation he suspects between items of the group. This ability to detect significant relations among apparently unrelated phenomena by a kind of direct examination is the distinguishing gift of the able observer.

Observational inquiry then in such a field, for example a clinical medicine may give results that are questionable on the one hand because too much value has been given to conclusions essentially based on *intuition*, and on the other hand because the possibilities of exact observation and record have been exaggerated. We are all familiar with instances of large and imposing masses of records vitiated with experimental methods though these relations may be less direct than in other sciences. In geology we may, for example, study in the laboratory some of the elements in the process of metamorphism though we can command no more than an almost negligible fraction of the time and the force that have gone to the formation of metamorphic rocks in nature. *In meteorology, again* we may study the differences of electric potential that are produced by the breaking up of falling water drops but we must remain almost infinitely far from the scale and magnitude of a natural thunderstorm. In astronomy a science of whose debt to experimental work there can also be no question the impossibility of reproducing in the laboratory the conditions of the natural event is still more apparent.

Thus in geology meteorology, and astronomy experiment occupies the position of the small scale model and is therefore subject in its degree to the defects of the argument from analogy. These sciences must in fact be described as sciences of observation and *collateral* experiment and have very plain methodical difference from the sciences of *direct* experiment such as physics and chemistry.

Experiment in the Biological Sciences

Physiology has been included here among the sciences of direct experiment and there can be no doubt of the thoroughness and success with which it has established itself there. It has been hinted however, that the case of physiology is to some extent different from that of the other sciences of direct experiment and its brilliant evolution has had to overcome difficulties special to it. The living organism has a certain perhaps indefinable, but not the less substantial unity, and it is this unit and not its constituent parts or processes that has been the material acted on by evolutionary forces. A physiological process may therefore be expected to lose something of its full natural character when it is isolated from the complete animal for purposes of experimental study. This consideration does in fact express one of the limitations of experimental physiology and one that is apt to become *increasingly manifest in the most advanced branches of* the subject. On the whole however, it is highly remarkable with what success the physiologist has been able to defy this limitation and to detach bodily processes into circumstances of such simplification, or such complete specification as to make study fruitful without unduly distorting their natural character. Such classical simplifications as the nerve muscle preparation, the isolated heart the spinal animal, have been justified beyond all question by the substantial additions to knowledge that have been made through them. These preparations cannot however fail to remind us sharply of the difference in the status of experiment in physiology and in physics and chemistry. The essence of a scientific experiment is the specification of its conditions. Now the [illegible] method of any bodily organ or [illegible] in medicine is its liability to the *post* and its *propter hoc* fallacy. The only means we possess of establishing a causal relation between events is to observe *their invariable occurrence in association*. The clinical observer cannot bring about at will the recurrence of events he wishes to study or strip them of irrelevant circumstances as can the experimenter. Moreover, his observations are necessarily made under the pressure of the fact that the events he looks for are not primarily material for science but primarily somebody's symptoms and the signals of somebody's *need for help*. This urgency in the very air of all clinical work does undoubtedly tend towards the finding of significant relations in sequences of events which longer and more thorough observation would have shown to be unrelated. The well-equipped clinician must possess the qualities of the artist the man of science, and the humanist, but he must exercise them only in so far as they subserve the getting well of the individual patient. It is a hard doctrine but none the less true that this essential function of the doctor—the care of the given patient—may involve the forgoing of exactly scientific diagnosis, of the artistic perfecting of an operation, or even of the interests of society at large

situation is complicated by the prejudice and the ethical limitations to which direct experiment in man is subject The effect of these circumstances has been to make the study of the processes of the human body in health and disease dependent chiefly on observation in man combined with experiment in animals Experiment in animals has had great success in solving the problems of human biology, and has provided one of the most complete proofs of the value of experimental science and of the general similarity of the fundamental vital processes in all animals At the same time, however, it must be recognized that these experiments have in the strict sense and in relation to man collateral rather than direct validity

The Application of Animal Experiment to Man

The success of animal experiment in human physiology and pathology has been so great and continuous that there has never been any serious call for its collateral quality to be dwelt upon With the increase of knowledge, however, and the need for a finer and finer penetration into the processes of health and disease, the usefulness of a closer critical examination of the actual state of affairs will probably become manifest To those whose work in human biology lies in the observational study of man rather than in animal experimentation the value of such an examination tends constantly to present itself The gap between man and any other animal is large even when judged on the crude basis of manifest structure When the relation of man to animals is regarded from the functional point of view the gap is seen to be larger and much more significant It may be useful to specify some of the biological anomalies in the situation of man which cannot be safely ignored in applying experimental results obtained in animals

The Upright Posture.—The simplest case in which the conditions common to most other animals have been drastically rearranged in man is the upright posture The essential mechanics of the skeleton and of the circulation were established, and as it were tried out, in quadrupedal forms through an enormously long space of time Upon this well-proved arrangement, and it would seem rather suddenly and without a fundamental mechanical reorganization was imposed a posture which threw on the old scheme fresh strains that have tried it to within reach of the actual margin of safety The results of this late and so to say hurried revision of the structural plan show themselves far and wide in the pathological field It is not unreasonable to see these strains as important factors in the so-called static deformities, and in the excessive liability of the lower limbs to diseases of the bones and joints and to circulatory disorders on both the arterial and venous sides Echoes of the same disturbing element are perhaps to be found in abdominal pathology, and even in the peculiarities of the cerebral circulation In general, [illegible] it is perhaps in relation to the special qualities [illegible] as a whole in man that the upright [illegible] of the circulation [illegible] in applying the posture should arouse the most cautious [illegible] results of animal experiment

Longevity.—The fact that in man survival to an age long past that of reproduction is a common event makes his general biological position in some way unique Morbid states that show themselves on the whole only when reproductive activity is normally running out at an end can have no selective elimination acting against them they can thus flourish untouched by what is probably the strongest of all checks upon diseases that normally have their range in or before the active period of sexual life It seems reasonable to suppose that an essential factor in the inveteracy of cancer and its excessive frequency in man is its existence in what we may call a biological backwater, where it has no effective selection to contend with The difference in frequency of sarcoma and carcinoma might perhaps plausibly be accounted for in the same way In applying the results of animal experiment to pathological conditions in man it seems likely that this peculiar feature in the [illegible] may be a cause of difficulty, and [illegible]

The Free and Unlimited Food Supply.—It is well [illegible] and in a general way the in[illegible] of the [illegible] emptiness of the stomach rather than to the nutritional needs of the animal concerned The usefulness of this arrangement is obvious if the impulse to seek food were felt only when the body was in need of it to carry on its functions there would be a risk that the animal would already have lost the energy necessary for the search The normal animal eats, then, because the stomach is calling for food, not because the body is calling for nourishment, and the physiological situation is satisfactory as long as the food is of low nutritive value, as in the herbivora, or has to be worked hard for, as with the carnivora Civilized man has broken through the natural safeguards of the process by obtaining a food supply unlimited both in nutritive value and in amount, but he still regulates his eating by the demands of his stomach rather than by the needs of his body The result is that by the time middle-age is reached the absence of some degree of adiposity is statistically abnormal, and may well give rise to a suspicion of disease Here again we find a gross functional discrepancy between man and animals which may well have a confusing effect in the application of experimental results

The Effects of Personality.—The living animal is a functional unit dependent on the close correlation and harmonious working of its parts There is no reason to suppose that there is any less essential need for harmony among its mental activities and between them and its bodily activities than there is for harmony in the bodily sphere itself In animals other than man disharmonies within the mind or between mind and body, though they sometimes give hints of their presence, are generally inconspicuous The relatively enormous development of mental activities in man has enlarged correspondingly the region in which a lack of harmonious working may arise Disharmonious mental states, such as those due to the clash of individual and social needs, are notoriously apt to interfere with bodily function to a degree and with a duration and constancy that may simulate organic disease and perhaps initiate it It is a fact unfortunately beyond contest that, though the interaction of mind and body presents problems to the importance of which lip-service has been abundantly paid, these problems have never received thorough realistic and scientific treatment The explanation of this deficiency may be in the consideration with which we are here specially concerned, that this is a region in which the functional gap between man and other animals is at its widest and most profound

The Function of Observation in Human Biology

We have pointed to some of the corrections which may have to be applied to animal experiment before its significance for man can be established There is, however, another limitation of the range of collateral experiment in human biology This is in regard to investigations in which access to the subjective side of experience is indispensable The relation between cerebral states and states of consciousness in the normal and abnormal, and the physiology and pathology of pain present problems of this class All these considerations taken together, while they can, of course, in no way depreciate the inestimable gifts human biology has got, and will probably continue to get, from collateral experiment, yet do suggest that for the finest and deepest insight into the most characteristic phenomena of man's life it will be necessary to use, with all its inherent restrictions, the method of direct experiment in man himself

Our knowledge of normal physiology in man, such as it is, is almost wholly due to the experimental method In the study of disease on the other hand, while the experimental method has been very valuable, and promises to be increasingly so it is to be noted that the method of observation has behind it a long and honourable history, but it cannot be denied that for a considerable time essential progress in our knowledge of disease has come less and less from the time-honoured method of observation and more and more from experiment Moreover, with all its opportunities observation has at its best been able to disclose but little of the fundamental processes of disease of the exact meaning of morbid phenomena, or of the precise mechanism lying behind symptoms, whereas experiment has a remarkable series of successes of these very kinds already to its credit In view of such considerations as these it may well be asked

whether the time has not come when it should be recognized with all the practical consequences that would follow, that observation can no longer be regarded as able to effect serious advances in medicine

The method of experiment studies phenomena under the simplified and specified conditions of the laboratory, the method of observation studies phenomena as they are presented in the random order of natural events The first tends to yield clear results capable of analysis by further experimentation, the second tends to yield broader, vaguer conclusions and its power of penetration by analysis is usually limited The first requires patience, caution, ingenuity the second, insight great familiarity with its material and what we may call the intuition of reality—that is to say, the power to choose among equally plausible hypotheses the one that best fits the general behaviour of the material in question In a very broad way it may be said that successful observation depends more directly on a special mental aptitude than does successful experiment

The chief limitation in practice on the value of even the best kind of observation is the difficulty in proving its conclusions and therefore of making them available to the general body of science We have said that successful observation is dependent on special aptitude and it is notorious that ten experiences will yield a great deal more to one man than a hundred of the same kind to another This of course, means that there must usually be a large intuitional element in the conclusions of the able observer, who is apt to be impatient of the drudgery of scientific proof, correspondingly careless in attempting it, and therefore little apt to advance substantially the scientific structure of his subject The evolution of medicine, which has been so largely dependent on it, illustrates in a peculiarly pointed way the disadvantages to which purely observational inquiry is subject The method failed to penetrate the nature of infective processes on the one hand, and on the other it ascribed, and indeed still ascribes, a wholly undue importance to insignificant climatic conditions as direct causes of disease It has held the key to the pathology of vitamin deficiency, to endocrine disorders, to the relation of malaria and mosquito, but has lacked the power decisively to enter into and exploit these new provinces It has had for the most part to leave unelucidated the events that connect the processes of disease with the symptoms they produce so that even to-day, for example, pain, which is by far the commonest of all symptoms, is the bugbear of diagnosis and treatment

The essential feature of the observational method is the recognition of groups of events of which the items are significantly related to one another The simplest case in the detection of such significant relations is when the suspected series recur in the same order often enough to be easily noticeable The study of disturbed function in the human body when it has passed beyond its most elementary stages does not, however, provide many sequences that by their invariable recurrence and unmistakable identity show that their items are interrelated The total body of phenomena accompanying disturbance of function is very large and very variable, so that the significant series which is being looked for may present itself in a different disguise of detail at each reappearance The simple method of establishing the significance of a group of phenomena by the dry statistical record of its invariable recurrence in given circumstances is thus not widely applicable in medicine, and the method of observation has not usually obtained its more considerable advances in this way More often the observer has to be content with a limited number of recurrences of the group of phenomena, and relies upon his close familiarity with and "feeling" for his material to confirm the relation he suspects between items of the group This ability to detect significant relations among apparently unrelated phenomena by a kind of direct examination is the distinguishing gift of the able observer

Observational inquiry then in such a field, for example, as clinical medicine may give results that are questionable on the one hand because too much value has been given to conclusions essentially based on intuition and on the other hand because the possibilities of exact observation and record have been exaggerated We are all familiar with instances of large and imposing masses of records vitiated at their very base by the preconceptions of their compilers or by the impossibility of precise record and with instances of the lineratic pronouncement that rises superior to the need of proof Neither of these misuses of the method however, can justify us in ignoring what has been done by it for medicine in the past or in concluding that the period of its usefulness is at an end

Before inquiring what function the method of observation may yet be able to serve it is well to bring to mind how little the medical sciences can afford to dispense with any means of inquiry that is not demonstrably and wholly sterile The success of the experimental method has been so great that it has become almost a fixed convention for any general comment on the course of science to deal almost wholly with the triumphs that have been attained by this method and but little with the tasks that have proved too hard for it This not unamiable weakness is perhaps partly to be explained and excused at any rate as far as this country is concerned by the constant hostile pressure against animal experiment and the consequent supposed need to justify it in season and out of season It, however, we free ourselves, as we may well do for a moment in so technical a discussion as this from propagandist optimism we shall very easily see that in the interests of science itself we should spare some attention from the triumphs that light up the past, for the need that darken the future The progress of science, when regarded with a due realism is seen always to have been sporadic, to have been subject to lapses of inspiration, to have gone forward in one part of the field at the apparent expense of slackening effort in another No better illustration of this irregularity in the line of progress could be found than in the fact that after over half a century of experimental pathology the four great scourges of man in temperate climates—influenza the common cold, cancer, and rheumatism—remain pathological problems so largely unsolved In the face of a fact like this it is plain that medicine cannot afford to leave unused any implement however imperfect—especially, perhaps, one to which a definite function otherwise unfulfilled can be assigned

In trying to define the field in which observation seems to have its characteristic use it is of advantage to get a clear idea of what actually are the chief defects and limitations inherent in the method Two of these are of such predominant importance that they need only be mentioned first, the limitation of the extent to which observation can be used in following a problem through stage after stage of elucidation until a fundamental solution is found, and secondly, the readiness with which the method lends itself to faulty or even wholly fallacious conclusions It may be thought that neither of these defects needs discussion, but perhaps the second has implications which are not always fully realized and which may repay some examination

Observation and the "post hoc" Fallacy

The characteristic defect of the observational method as commonly used in medicine is its liability to the *post hoc propter hoc* fallacy The only means we possess of establishing a causal relation between events is to observe their invariable occurrence in association The clinical observer cannot bring about at will the recurrence of events he wishes to study or strip them of irrelevant circumstances as can the experimenter Moreover his observations are necessarily made under the pressure of the fact that the events he looks for are not primarily material for science but primarily somebody's symptoms and the signals of somebody's need for help This urgency in the very air of all clinical work does undoubtedly tend towards the finding of significant relations in sequences of events which longer and more thorough observation would have shown to be unrelated The well-equipped clinician must possess the qualities of the artist the man of science, and the humanist but he must exercise them only in so far as they subserve the getting well of the individual patient It is a hard doctrine but none the less true that the essential function of the doctor—the care of the given patient—may involve the forgoing of exactly scientific diagnosis, of the artistic perfecting of an operation, or even of the interests of society at large.

It is therefore obvious that the influences against the making of scientific observations by those in the actual practice of medicine are very strong and it is not surprising that the experimenter is apt to find the clinician on the one hand prolific of unsound conclusions and on the other timid and sceptical in applying the results attained in the laboratory by experiment No better illustration could be found of the characteristic weakness of clinical methods than the extent to which the ascription of disease to trivial climatic discomforts is still accepted or at least tolerated Colds and phenomena of the order of draughts and wet feet—alleged causes of colds—are sufficiently common to afford ample opportunities for the discovery of insignificant sequences This fact, together with the psychological influences tending to associate healthy with comfortable conditions, has produced a veritable folklore pathology of colds and chills which true scientific observation would speedily explode, and which presents clinical medicine in one of its least edifying aspects There are, however, probably even deeper roots of the inveteracy of the *post hoc* fallacy in medicine If two events A and B occur repeatedly in the same order, experience teaches us to regard them as having the relation of cause and effect—that is to say, of being so related that whenever A appears it will be followed by B, and wherever B is observed it will be found to have been preceded by A To establish this relation with any great degree of probability the observed recurrences of A and B in that order must be numerous, must be without exception, and the identity of A and B in each observation must be clear In clinical observation these requirements cannot usually be satisfied with unambiguous severity, the able observer, therefore, while constantly trying to satisfy them as far as the case permits, will depend more or less on the insight and sense of reality that his familiarity with his material and his natural aptitude have given him

It is notorious that a conviction of the existence of a causal relationship between two events—a very different thing from the objective proof of such a relationship—is far from being dependent on such deliberate and cautious procedures In everyday affairs, and to a certain extent in the general run of clinical work, the number of accepted causal relationships far exceeds the number of demonstrated and even of probable cases It seems likely, then, that there is some strong natural tendency which inclines us to ascribe causal relations to events accidentally and arbitrarily occurring near one another That we have such a tendency is at least suggested by the work of Pavlov on conditioned reflexes The essential facts of this work are familiar and need not be recalled in detail In a dog in which a salivary fistula has been established so that the flow of saliva can be measured, the presentation of food is followed at once by a profuse secretion Some arbitrarily chosen stimulus such as the sounding of a metronome is now made to precede immediately the offer of food After this sequence has been repeated a few times it is found that the auditory stimulus causes a similar salivary flow without any presentation of food The cerebral cortex has been taught by a very short experience to accept the metronome sound as a precursor of food In mental terms the sound has become a "cause" of food and an intelligent dog might classify metronomes in the group of things to be hunted like rats and rabbits The facts especially to be noted for our purpose here are first the readiness with which the link of apparent causation is established, secondly, the arbitrariness of the sequence metronomes having no relation with food in the general objective world and thirdly the fact that the relation can be fixed only by adding it to a reflex already established—namely, a natural reflex—in this case the visual salivary reflex

[illegible] has been said earlier in this paper to enjoin [illegible] applying the results of experiments in animals [illegible] caution must, however, be especially stringent [illegible] right conclusions from cerebral [illegible] Nevertheless it is clear enough that there [illegible] close analogy between the aptitude for [illegible] into conditioned reflexes on the one hand [illegible] on the other hand the tendency too readily to ascribe the causal relation to small and unrelated sequences of events, and we may at least suspect that the subjective sense of causation we so easily derive from a few random coincidences is connected with the proved capacity of the brain to pick up arbitrary and as it were "irrational" reflexes The conditioned reflex then is perhaps the simplest case of the *post hoc* fallacy When we thus see reason to suspect that our tendency to impute causal relations unjustifiably may be the expression of a characteristic cerebral function we need not be surprised that this fallacy is so common and so difficult to avoid

We are now in a position to review shortly the disadvantages of the observational method in the study of medical problems as we see it in actual use These disadvantages fall into three groups

1 The method as an instrument of inquiry is of limited range In the systematic attack on a given problem carried on stage by stage until a solution is reached it is notably weak compared with the experimental method to which, in this function, it must always and of necessity remain grossly inferior

2 The method is known as a matter of experience to be especially open to the *post hoc* fallacy Though this may not be fundamental and essential as is the limitation noted above we have seen that there may be an organic predisposition underlying it

3 In clinical medicine the difficulties of securing objective proof by exact observation of identically recurrent events are very great This tends to make the observer rely on intuition rather than on established conclusions and to make him impatient of the labour of proving or disproving the truth of opinions arrived at by intuition The result is that the current clinical medicine of any given period is apt to be loaded with "authoritative" opinions often contradictory of one another, many of which are actually capable of, but have never been submitted to, definite proof or disproof

Limitations of the Experimental Method

Experiment is observation made in specifiable and controllable circumstances and it seeks to eliminate that dependence on the personal judgement, the tact, the intuition of the observer which is the weakness of the observational method If we imagine a problem to be attacked and solved independently by experiment and by observation, the solution by the latter method, in addition to having taken longer and being less exact, will generally have demanded a more arduous and intricate intellectual exercise than the solution by the former

This economy of experiment in its demands upon certain of the less definable aptitudes of the mind is no doubt a contributory cause of its great success as a method, but probably it has secondary consequences which in the long run and on the large scale are not wholly advantageous A science which is strictly limited to the experimental method is apt to favour in its workers a tendency to deprecate any great speculative activity and to regard an interest in the free play of ideas for their own sake as evidence of a lack of scientific stability and trustworthiness Such a distrust of the intellect involves an unsound view of the function of ideas in science It is a mistake to suppose, as it is so easy to do, that science enjoins upon us the view that any given idea is true or false and there is an end of it, an idea may be neither demonstrably true nor false and yet be useful, interesting, and good exercise Again, it is poverty rather than fertility of ideas that causes them to be used as a substitute for experiment, to be fought for with prejudice or decried with passion When ideas are freely current the keen science flesh and living and are in no danger of ceasing to be the nimble and trusty servants of truth We may perhaps allow ourselves to say that the body of science gets from the steady work of experiment and observation its proteins, its carbohydrates, and—sometimes too profusely—its fats but that without its due medium of the vitamin of ideas the whole organism is apt to become stunted and deformed, and above all to lose its resistance to the infection of orthodoxy

The state of inorganic chemistry in the early nineties of the last century showed some traces of the conditions

one an irregular rhythm persisted in spite of partial thyroidectomy, but normal rhythm returned after 154 grains of quinidine and has persisted for two years. Thus of the 11 cases of permanent auricular fibrillation operated on, normal rhythm was restored and remained permanent in 6, whereas in 5 the irregularity persisted, thus restoration of the normal rhythm occurred in 55 per cent.

Of the 356 cases investigated the total mortality could be traced. Of this number one patient who had exophthalmic goitre complicated by auricular fibrillation and severe cardiac damage, died without any operation being performed. All the remaining deaths occurred after operation. Of these, 17 occurred in exophthalmic goitre cases and 7 in toxic goitres. Three of the exophthalmic goitre cases, however, were those of patients with auricular fibrillation and for these one occurred after partial thyroidectomy, a second after lobectomy, and a third after ligation of the right superior thyroid artery only.

Partial thyroidectomy with removal of three-quarters to seven-eighths of the gland was the usual procedure, unless there was a definite contraindication when a primary ligation of one or more of the thyroid vessels was followed three or four months later by partial thyroidectomy. Only one death ensued after simple ligation—namely, the case with auricular fibrillation already mentioned.

The following table (Table II) shows a comparison of the absolute and percentage mortality after operation between cases of Graves's disease, with and without auricular fibrillation.

TABLE II

Condition	Total Cases	Absolute Mortality	Percentage Mortality
Exophthalmic goitre without A F	293	13	4 4
Toxic goitre without A.F	33	3	9.1
Exophthalmic goitre with A F	19	3	15 8
Toxic goitre with A.F	7	0	0
Total cases of Graves's disease without A F	326	16	4 9
Total cases of Graves's disease with A F	26	3	11.5

Although the numbers are small the post-operative mortality is increased by the presence of auricular fibrillation in these cases. The percentage is more than doubled. Another fact brought out by the above table is that the presence of auricular fibrillation in exophthalmic goitre is of much more serious import than in toxic goitre. *This is not surprising if one considers the view expressed* in an earlier part of this paper—namely, that auricular fibrillation is a natural sequel of prolonged thyrotoxicosis, such as occurs in patients with toxic goitres, whereas its occurrence in exophthalmic goitre, in which the symptoms are usually of a few months' duration only, points to a severe grade of poisoning. On the other hand the mortality of exophthalmic cases without auricular fibrillation is less than half that of toxic goitres without auricular fibrillation.

The presence of auricular fibrillation in Graves's disease must be considered a distinctly unfavourable complication as regards the operative risk. It is associated, as a rule, with cardiac enlargement, a rapid pulse rate, and signs of congestive failure. The effect of the excessive thyroid secretion, as shown by the raised basal metabolic rate, is aggravated by an added impairment of cardiac function due to the congestive failure. It is essential, therefore, that the thyrotoxicosis should be reduced, and the ventricular rate controlled, before operative procedure is contemplated. At the Royal Free Hospital Lugol's solution in increasing doses up to 30 minims daily and digitalis tincture in doses of 10 to 20 minims three times daily are given, until the optimum state of the patient is reached, and the nature and extent of the operation is dependent on the degree of improvement attained. Digitalis is well borne by these patients, and they can take larger doses than patients suffering from other types of auricular fibrillation without intolerance. I have never found any untoward effect from digitalis medication.

Conclusions

1. Auricular fibrillation occurs rather more frequently in toxic than in exophthalmic goitres.
2. Its presence in exophthalmic goitres is more serious than in toxic goitres, as shown by the increased post-operative mortality.
3. Auricular fibrillation is not of itself a contraindication to operative treatment, although it is an added risk.
4. The need for thorough pre-operative medical treatment is intensified by the presence of auricular fibrillation.
5. Primary ligation deserves careful consideration as a means of treating severe cases. In most cases, when one or more of the thyroid vessels have been tied the improvement in the general and cardiac condition of the patient has allowed the major operation to be performed without undue risk.

My thanks are due to my colleagues Mr. Cecil A. Joll and Mr. L. F. C. Norbury for their kindness in giving me the opportunity of collaborating with them in the treatment of their cases, and to Miss Geraldine Barry, surgical registrar, for her help in collecting certain particulars for me from the case records.

URETHRAL CALCULI—ANCIENT AND MODERN

BY

A. J. UPQUHART OBE., M.B., D.P.H.,

PROFESSOR OF PATHOLOGY, UNIVERSITY OF EGYPT

DURING the last year two urinary calculi have been presented to the Pathological Museum of the University of Egypt. These calculi show so remarkable a resemblance of form, the one to the other, that I have ventured to make a few notes upon them.

The smaller stone (Fig. 1) was removed in December 1928, by Dr. Kattih, assistant surgeon to the Kasr-el-Aini

FIG. 1. FIG. 2.

Hospital, Cairo, from the urethra of a boy 8 years of age. The history which accompanied the specimen stated that the child complained of a lump in the scrotum and perineum. No complaint was made of pain or frequency of micturition. The flow of urine was not interfered with. A slight urethral discharge was present. The stone was cut down upon and removed, and the boy made a perfect recovery. The stone itself weighed 41.5 grams, and is

seen to consist of a large lower bulbous portion, a somewhat indistinct neck, and an elongated extremity The surface of the stone is almost smooth In length it measures 2 75 inches, while its greatest diameter is 1 5 inches Some particles removed from the outer surface give the chemical reaction for phosphates When the stone was removed from the urethra it was found to be lying in a widely distended urethral canal The large globular mass rested in the bulbar urethra, the slim end extended towards the bladder The wall of the urethra was inflamed but showed no sign of actual ulceration

The larger stone (Fig 2) was presented to the museum in 1929 by Mr Guy Brunton, who found it in the grave of a man of the early 18th Dynasty, while he was undertaking archaeological research some twenty miles south of Assiut The stone was found in the neighbourhood of the pelvic bones The stone, though larger in every way than that previously described, bears a very strong family likeness to it This specimen weighs 110 5 grams, in length it is 3 75 inches, while its greatest diameter is 2 75 inches It consists also of a bulbous lower portion, a neck, which is marked by a very evident sulcus, and an elongated extremity The surface is rough, as if it had been lying in a septic cavity Scrapings from the surface give the phosphatic reaction

In comparing the two specimens so similar in shape and moulding, one might suggest that as the former is known to have occupied the urethral canal of a boy of 8, the other might well have occupied a similar position in the man of the 18th Dynasty The sulcus, which is very evident and forms the neck of the stone obtained from the adult, is present to a lesser degree in the stone from the boy, and has probably been produced by the pressure of the anterior layer of the triangular ligament We also know that a stone weighing 41 5 grams can be accommodated by the urethra of a boy of 8 years without causing any grave inconvenience Could not the adult urethra accommodate a calculus of 110 5 grams? In this case, however, the roughened outer surface of the stone suggests that a considerable urethral discharge was present, due to some inflammatory disturbance about the area occupied by this calculus

PNEUMONIA AND EMPYEMA DUE TO A NON-LACTOSE-FERMENTING BACILLUS

BY

A D FRAZER, M B, CH B
(From the Bacteriology Department, Royal Infirmary, Edinburgh)

THE following is an account of a case of pneumonia and empyema apparently caused by a non-lactose-fermenting coliform bacillus possessing special biochemical and agglutinative characteristics

HISTORY OF CASE

The patient a man aged 21, was admitted on January 19th 1929 as a case of "influenza" He gave a history of pain in the back and limbs headache sore throat, and slight cough commencing suddenly twenty four hours previously His temperature was 103° F his pulse rate 98, and his respiration rate 24 No abnormalities was detected on examination of the chest He was treated with antipyretics

On January 21st the temperature fell and the patient felt better Four days later he had pain in the left side of the chest and a dry cough His temperature was 103° F his pulse rate 88 and his respiration rate 30 Pleural friction and a small area of dullness appeared below the left scapula Within one week the temperature had settled and the patient's general condition was greatly improving

On January 31st he developed pain in the right side of the chest and a dry cough His temperature was 102° F, his pulse rate 140 and his respiration rate 40 The patient felt and looked ill Pleural friction was present on the right side A right pleural effusion developed and slowly increased during the following week A septic temperature of the swinging type persisted [illegible] was introduced into the right pleural cavity and a purulent fluid was withdrawn On four more occasions pleural fluid was withdrawn and finally the patient was sent to [illegible] and drainage of the pleural cavity was carried out During the whole illness [illegible]

BACTERIOLOGICAL EXAMINATION

Three specimens of pus aspirated from the pleural cavity on different dates were examined, and a Gram-negative bacillus was isolated on each occasion, giving the same biochemical and agglutination reactions

Morphology and Fermentation Reactions

A profuse growth on agar was obtained in twelve hours of colonies having the typical appearance of the coliform group and consisting of highly motile Gram-negative bacilli about 4 μ long and 0 5 μ broad, showing the following reactions when observed over a period of thirty days

Glucose, mannite, maltose, sorbite, and galactose formation of acid and gas
Lactose, saccharose, dulcite, salicin, inulin, adonite, and raffinose no change
Litmus milk slight acid and curdling by fourth day, alkaline from eighth day onwards
Lead acetate no blackening
Gelatin not liquefied in six weeks
Indole reaction negative

The organism therefore differed biochemically from the salmonella group only in its failure to attack dulcite Most members of the salmonella group produce acid and gas in inosite, but some, like this organism, do not Blood culture yielded no growth This was taken when the temperature had fallen, too late to be of much value

Agglutination Tests

A Widal test yielded the following results

Patient's serum + B paratyphosus A = no agglutination
Patient's serum + *B typhosus* = agglutination up to 1 in 15
Patient's serum + *B paratyphosus* B = agglutination up to 1 in 120
Patient's serum + unknown organism = agglutination up to 1 in 3,200

The organism was then typed against stock antiserums for *B typhosus* B, *Paratyphosus* A, and Gaertner's bacillus, but no agglutination was obtained The results of typing against antiserums for *B paratyphosus* B and *B aertrycke* (Glasgow) were as follows

Emulsion of Organism	Dilutions of B paratyphosus B Antiserum						
	100	200	400	800	1 600	3 200	6 400
B paratyphosus B	+++	+++	+++	+++	+++	+++	+++
Unknown organism	+	+	±	∓	−	−	−
B aertrycke (Glasgow)	++	+	+	+	±	−	−

Emulsion of Organism	Dilutions of B aertrycke (Glasgow) Antiserum							
	400	800	1 600	3 200	6 400	12 800	25 600	51 200

a rabbit at five-day intervals in doses of 0 1, 0 2, 0 5, and 1 c cm The rabbit's blood was drawn off twelve days after the last injection and set up against emulsions of various organisms

DISCUSSION

These tests show that while the organism has, antigenically as well as biochemically, something in common with *P paratyphosus* B and *B aertrycke* it is distinct from these organisms

The clinical course of the infection bears a striking resemblance to that of many cases of psittacosis The sudden "influenzal" type of onset, the dry cough, the slow pulse and respiration rate compared with the high temperature, are found in psittacosis, but there is no history in the case of contact with a parrot, and the organism differs from the strains which used to be considered the cause of psittacosis

Eighteen months previously the patient had been inoculated with T A B vaccine, and this might account in part for the high agglutination of *B paratyphosus* B by his serum, but the group relations demonstrated between the infecting organism and *B paratyphosus* B are more likely to account for this agglutination

The organism is therefore closely allied to the *paratyphosus* B–*aertrycke* group, but differs materially from these organisms in failure to ferment dulcite and in its specific serological qualities

I wish to thank Dr Logan for his advice and interest during the study of this organism and Dr Goodall for permission to use the case notes The expenses of the investigation were defrayed by a grant from the Moray Fund

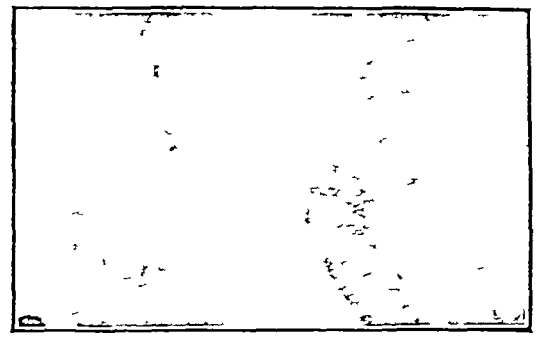
CONGENITAL DISLOCATION OF THE KNEES TREATED BY MANIPULATION

BY

GAWAD HAMADA, M P C S,

ORTHOPAEDIC SURGEON GOVERNMENT HOSPITAL ALEXANDRIA, EGYPT

THE case under consideration is that of a baby girl who was brought for treatment with double congenital dislocation of the knees when only 16 days old With the exception of this congenital deformity she was normal and well developed The delivery was a non-complicated vertex The knees could manually be acutely hyperextended on the thighs, but could not be flexed A photograph taken



Before treatment After treatment.

reveals hyperextension with resultant folds on the dorsum of the limb above and below the knees. The left leg was in a position of valgus with eversion, the right did not have this malposition

Manipulation was started on the right knee, and the limb placed on a malleable posterior splint which was bent to the required angle after each manipulation Daily massage was ordered for the posterior muscles of the limb Treatment of the left knee was started a fortnight later, the right was then progressing favourably The sittings were twice weekly for the first month and later once weekly, without any anaesthesia When flexion was advancing the posterior splint had to be changed for an angular malleable anterior splint In four weeks the right knee was completely reduced, and later the child resisted any hyperextension, and cried when this was attempted The left knee was more troublesome owing to the eversion of the leg This, however, has now been reduced The child has been under treatment for the last eight months and can be supported on her limbs, the knees being quite stable

Radiographs were taken before and after treatment, the latter showing reduction of the dislocation The left limb shows traumatic separation of the periosteum produced by the forcible correction of the eversion

Left knee before treatment. Left knee after treatment.

Right knee before treatment. Right knee after treatment.

Such cases as the one here recorded are comparatively rare, and, when not complicated by the congenital abnormalities, are undoubtedly due to malposition *in utero*, and should yield excellent results with simple conservative manipulation without anaesthesia when taken in hand early

Memoranda:

MEDICAL, SURGICAL, OBSTETRICAL

THE VITAMIN A CONTENT OF GHEE

GHEE is the clarified fat of cow's milk or buffalo's milk According to E R Bolton,[1] "it is prepared by inoculating freshly boiled milk (usually buffalo) with sour milk, and after curdling has taken place, churning in a rather primitive manner The fat so obtained is skimmed off, allowed to become somewhat rancid, and then heated in earthen pots until the water has evaporated The fat clarifies on standing, and when sufficiently clear is run off from the sediment and constitutes 'ghee'" This heating or "rendering" is in some cases followed by a second similar treatment, or "re-rendering" Ghee is an important constituent of Indian dietary its vitamin content is consequently a matter of considerable interest

In 1922 Ghose[2] recorded some observations on ghee, in which he found vitamin A to be present His results were obtained before vitamin A had been distinguished from vitamin D They are therefore subject to the same inconsistencies of interpretation as are all results of investigation into the fat-soluble vitamins before that distinction had been recognized By the courtesy of Dr F N Moos of the Goculdas Tejpal Hospital, Bombay, we were recently put in possession of five samples of Indian ghee The first example was of unspecified origin, and was not further examined The remaining samples, Nos 1, 2, 3, and 4, came each from a different hospital in or near Bombay

[2] Ghose *Biochem Journ* 1922, xvi, 35.

then behave towards the invading bacteria as though they were saprophytes but this is hardly an explanation of the mechanism of the phenomenon, it is merely a restatement of the end-result observed Of one thing the author seems quite convinced, and that is that antibodies play no part in bringing about this immunity though his reason for thinking so—namely that no antibodies are capable of demonstration—does not seem to us entirely satisfactory In passive immunity to a virus such as vaccinia or foot-and-mouth disease, for example, it would be extremely difficult to demonstrate the presence of antibodies in the passively immunized animal though one knows that the insusceptibility of its tissues is the work of the antibodies contained in the serum inoculated But Besredka would have little use for such an argument

The last chapter of the book is devoted to local serotherapy and the author cites many examples to show how much more effective it is to apply an antiserum direct to the seat of infection than it is to apply it indirectly via the circulation This would appear logically sound, and probably most people would agree with him but they would not accept his explanation of the mode of action of the antiserum Antivirus excites immunity by desensitizing cells not by calling forth the production of specific antibodies and since an antiserum locally applied is equally effective in producing an immune state, it must therefore contain antivirus Such reasoning is surely unsound However, leaving aside the question of how antivirus acts, what can be said of the therapeutic results obtained by its aid? The major portion of the book is devoted to this, and glowing accounts are given of the cures to be obtained by this form of therapy in the different realms of disease It is somewhat surprising that a method so simple of application—which can so rapidly effect a cure of such obstinate conditions as long-standing blepharitis and chronic cervicitis and various forms of colitis, to cite only a few examples—should have little or no vogue in this country

The majority of the workers in England who have essayed Besredka's methods are not enthusiastic, whereas on the Continent wonderful successes are recorded What is one to believe? As in most disputes of this kind the whole truth is probably with neither party

HUMAN BIOLOGY AND RACIAL WELFARE

Dr E V Cowdry has edited a collection of twenty-five essays in a volume entitled *Human Biology and Racial Welfare*[1] by twenty-eight contributors nearly all from the United States of America, among whom Professor J F Fulton, who was recently elected to the chair of physiology at Yale, collaborates with his former chief, Sir C S Sherrington on nervous integration in man Specialization is essential for the advance of knowledge, but there is a real danger that the individual worker may thereby tend to become isolated and narrow-minded This liability to thought-tight compartments is also unfortunate for science as a whole, because many of the problems urgently crying for solution are on the borderland of the sciences which make up human biology, and therefore require team work This book, which is accordingly designed to obviate the drawbacks of specialization, is intended for two groups of readers in the first place for students, especially those of medicine, who are about to specialize and can do so more intelligently after they have seen in perspective what lies ahead of them, and secondly for more mature men occupied in science or business who are anxious to gain a deeper insight into the problems of life

The work is divided into five parts the first, on life in space and time, is written by Professor H Norris Russell director of the Princeton University Observatory In the second part, on the origin of man, there are six articles Professor A B Macallum deals with the biochemistry and other aspects of evolution such as the cerebral and the mental in the classification of the races of mankind Aleš Hrdlička, curator of the division of physical anthropology U S National Museum Smithsonian Institute, considers but dismisses the theory of recent generation Part 3, on man as a physiological unit, naturally begin with the editor's description of the vital units called cell and is continued by Dr Alexis Carrel's essay on the relations of cells to one another by Professor W B Cannon on the integrative action of the nervous system, by Sir Charles Sherrington and Dr J F Fulton *on nervous integration in man* and Dr Clark Wissler professor of anthropology at Yale on the integration of the sexes—marriage The important subject of the effects of environment is discussed in no fewer than eight articles on the influence of special factors such as climate food rural or urban residence, and education, the contributors including Sir Humphry Rolleston and Professors Hrdlička Emerson McCollum and Zinsser The fifth and last part of this interesting volume is entitled 'The future' and begins with an able article on the inheritance of disease by the late Paul A Lewis who lost his life while investigating yellow fever at Bahia Brazil last year Professor Raymond Pearl writes with authority on the biology of human populations Dr C B Davenport on the *mingling of races and Professor Conklin on the purposeful* improvement of the human race

We must heartily congratulate the editor on the success of a work embodying a great deal of valuable information by such an eminent team

NASAL SINUSITIS AND GENERAL MEDICINE

THE views of Dr PATRICK WATSON-WILLIAMS on the accessory sinuses of the nose as a site of focal sepsis have long been familiar through the medium of numerous papers, lectures and demonstrations In *Chronic Nasal Sinusitis and its Relation to General Medicine*[2] he has now collected much of this scattered material and presented his matured opinions In this country it was Dr William Hunter, one of the great men to receive no official recognition who introduced the new principle of focal sepsis into medicine, and it is now accepted as commonplace It must, however, from its nature suffer from a certain vagueness and lack of sharp definition and consequently it lends itself easily to exaggeration The tendency is carefully avoided by Dr Watson-Williams in his own domain and he spares no pains to support his thesis with full pathological data taken from both morbid anatomy and bacteriology He is less cautious in accepting the statements of others, for example when it is said that focal sepsis can produce errors of refraction, though it may be admitted that such errors might not cause symptoms in the absence of toxic absorption, and, again, the statement that a certain type of optic neuritis, "the abdominal eye," is regularly cured by removal of an infected gall-bladder, recalls some line of thirty years ago, written by a well-known medical versifier, and entitled "All my eye"

All the possible systemic manifestations of focal sepsis are fully described, but to specialists those parts of the book which will be most instructive are the chapters on endorhinoscopy, on diagnostic suction, and on operative technique The part on nasal endoscopy describes in detail the use of the electric endorhinoscope and is illustrated by a number of fine drawings which almost make a small atlas of the subject It seems that this instrument has not come into use so generally as it deserves The author shows that it can provide information to be obtained in no other way The diagnostic and operative technique demanded in the class of case under consideration has been evolved by Dr Watson-Williams himself but as the accessory sinuses of the nose have been the subject of intensive study by distinguished writers in many different countries it is not likely that his conclusions will be universally accepted, nor does he expect it Nevertheless his opinions and methods are worthy of sympathetic attention The presentation of the case as a whole is not altogether happy There is much repetition, which often makes tedious reading important misprints are too numerous, and the legends below the radiographs on page 130 are misplaced

EDUCATIONAL PSYCHOLOGY

An excellent book for those who are interested in the application or contribution of psychology to education is the volume entitled *Educational Psychology*,[5] by Rudolf Pintner, a professor in Columbia University. It is no doubt intended primarily for teachers themselves, but it should attract a wider class of readers than this. Parents may derive considerable benefit from its perusal, and it should help many medical practitioners to a better understanding of problems in connexion with the education of children upon which they are often asked to give advice. It has a bearing upon the training of the adolescent and the adult as well as on the schooling of children. It does not follow the older conventional psychological arrangement adopted by many other textbooks of the subject, but accepts the more modern presentation, and has regard to the recent developments in the field of psychological and educational measurements. In this case, at any rate, there is justification for the publishers' note, which claims that the book is "an admirably lucid and comprehensive exposition. Professor Pintner has sifted the whole of psychology and given, in simple and practical form, the essentials needed for educational purposes. The interest is enhanced by many charts and diagrams, and the whole forms an admirable introductory textbook to the subject."

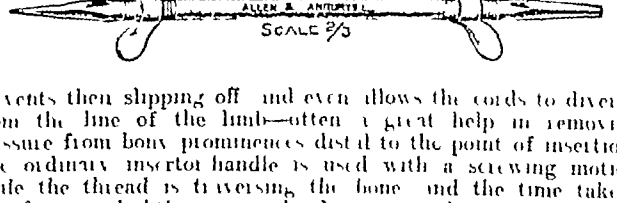
The author treats his subject in two chief divisions: the original nature of the individual to be educated, and the modifications of that nature which it is desired or desirable to attempt to bring about, it is recognized that this division is merely a matter of convenience and largely artificial. "We never find original tendencies and modifications clearly differentiated in any individual. Modifications begin at birth and are continually taking place. Yet every modification is influenced by the original tendencies of the child. There is thus a continual interaction." In the first part of the book there is an adequate and well-proportioned discussion of reflexes, instincts, emotions, and capacities, and a sane appraisement of the measurement of the last by means of intelligence tests. In the second part the subjects dealt with are the laws of learning, effective and economical methods of learning, the permanence of modifications, the reciprocal effects of modification, fatigue, and the best methods of testing progress in school subjects.

In two respects the book is particularly noteworthy. The author considers conditioned reflexes in relation to education, though not, we think, with the adequacy the subject demands. It is however, a considerable advance to have a few pages devoted to them in a book on educational principles and methods. Further, the whole treatment of the subject of the transfer of training—that is the effects produced by training or modification in one department or subject upon other departments or progress in other subjects—is admirable and should be of great value. The wide claims for such effects which have usually been made and are still current deserve the careful examination which Professor Pintner gives them, and there can be little doubt that they must be seriously discounted. Especially may those who are responsible for the general education of pupils destined for the medical profession consider the position of the teaching of Latin and of elementary science in this regard. This is an important section of the book and in it, as in other sections, the author bases his conclusions upon actual experience and scientifically conducted investigations, and expresses them with commendable clearness and moderation.

NOTES ON BOOKS

[illegible] of revision before [illegible] to your [illegible] medicine condensed into a book of [illegible] pocket it is natural that the statements made [illegible] concise, but not always able to stand [illegible] their meaning. Thus in the new edition of *Aids to Medicine* by Dr. J. L. Livingstone we find under glandular [illegible] causes are enlarged tonsils and [illegible] there any other basis than [illegible] Must not both the enlarged tonsils and the enlarged glands be due to the tubercle bacillus? Has anyone ever traced a tubercle bacillus through a carious tooth to a gland? We ask these heretical questions because it seems a pity that students are not trained in clear thinking. The tonsil may be suggested as the probable portal of entry for the bacillus to the gland, a tonsil enlarged from some other cause may possibly encourage entry, but the student should not be led dogmatically to associate enlarged tonsils and tuberculous glands. However, if more exact methods of description were used in *Aids to Medicine*, perhaps the book would no longer go into the pocket of the examinee.

[illegible] Pintner. [illegible] Williams and [illegible] 36s. net. Figure. 10s. 6d. net.) [illegible] Livingstone, M.D., M.R.C.P. [illegible] Tindall and [illegible] 5s. net.)



Sir JAMES CRICHTON BROWNE has celebrated his ninetieth year by gathering together into a little book, entitled *What the Doctor Thought*,[7] sundry reflections, amusing stories, and notes on distinguished people whom he has met. In it, as a reviewer recently stated in the *Morning Post*, "wisdom and the oldest jokes are to be found side by side." As an instance of the humour which pervades the stories we may take the account of a dinner at William de Morgan's house in Florence. The conversation turned on spiritualism and all the guests related experiences except one lady, who, while helping herself to rissoles, declared that she would never believe in the supernatural unless some event, however trivial, which could not be explained rationally, happened to her. When the guests were leaving, and de Morgan was lifting the lady's cloak off a peg, an article shot out from the hood and hit her on the nose. De Morgan suggested that the article must have been a mouse with Alpine proclivities, but after a search it proved to be a cold rissole. "All possibilities of a practical joke were excluded," says Sir James. But he begins his next paragraph, dealing with a totally different matter. "I realized how painstaking de Morgan was in his work when, etc."! As a type of Sir James Crichton Browne's reflections we may take his criticism of Lord Rosebery's statement that Dr. Johnson "was born scrofulous, half blind, and with an hereditary melancholy not far removed from madness." Sir James's view is that the scrofula came from a cow with a tuberculous udder, the blindness from a dirty midwife, while the melancholy came from the doctor's alimentary canal, and might have been relieved with buttermilk.

[7] *What the Doctor Thought*. By Sir James Crichton Browne, M.D., LL.D., F.R.S. London: E. Benn, Ltd. 1930. (Cr. 8vo, pp. 284. 7s. 6d. net.)

PREPARATIONS AND APPLIANCES

A MODIFIED STEINMANN'S PIN

Dr. JAMES H. CARIAX (orthopaedic house surgeon, St. Thomas's Hospital) writes: A modification of Steinmann's pin now in routine use in the orthopaedic wards of St. Thomas's Hospital is illustrated below. It differs from the standard pattern only in that it has a screw thread at each end on to which fits a winged nut. When cords are attached to the pin the nut

prevents them slipping off and even allows the cords to diverge from the line of the limb—often a great help in removing pressure from bony prominences distal to the point of insertion. The ordinary inserter handle is used with a screwing motion while the thread is traversing the bone and the time taken, therefore, is slightly increased. Nitrous oxide anaesthesia still suffices for adults while as previously gentle extraction requires no anaesthetic. The pin is made by Messrs. Allen and Hanburys, Ltd.

PREPARATIONS OF EPHEDRINE

We have received from the British Drug Houses, Ltd., samples of various preparations of ephedrine and its hydrochloride. This alkaloid is an exception among new drugs, for not only has it maintained its initial popularity but it is in addition finding a steadily increasing range of employment. In particular, it is proving of real value in the relief of a number of common ailments. The wide range of utility of ephedrine is indicated by the fact that British Drug Houses, Ltd., are issuing a variety of preparations—namely, tablets and elixir for oral administration, ampoules for hypodermic injection, inhalant, throat spray, and nasal jelly. The dose for oral administration is 1/2 to 2 grains, and the inhalants and nasal jelly contain 1 per cent. of ephedrine alkaloid.

The chief use of the drug is in the relief of asthma, but oral and local administration has also proved successful in the treatment of hay fever, and local administration is stated to produce considerable relief in the common cold. Oral administration is reported to benefit whooping-cough. In addition to these actions on the respiratory passages the pressor action of the drug has been utilized for relief of shock.

INVESTIGATION OF ASTHMA.

REPORT BY ASTHMA RESEARCH COUNCIL

In a leading article published in the *British Medical Journal* of June 21st the work of the Asthma Research Council, and of independent observers of this and allied conditions, was discussed. A disease of which the etiology remains obscure, asthma is under investigation from several aspects, and probably boasts as many forms of treatment as the common cold. Cases may be grouped as those which show asthma associated with allied conditions, such as migraine, hay fever, urticaria, eczema, and biliousness in childhood, and those in which asthmatic attacks appear to be the only symptom of ill-health. The findings of many workers, discussed in our recent article, point to alimentary toxaemia as a probable cause of asthma in some cases, achlorhydria and hypochlorhydria are common in asthmatic children, and flatulence is a frequent accompaniment of asthmatic attacks. The presence in the urine of a proteose to which the patient is extremely sensitive is possibly a secondary effect of incomplete protein digestion, and marked improvement, even recovery, has followed desensitization to this proteose. The omission of meat and potatoes from the diet usually reduces flatulence considerably and improves the asthma. *The upper respiratory passages are under suspicion* of harbouring a histamine-producing Gram negative bacillus, which is responsible for asthmatic attacks in other cases. Sinusitis is common among asthmatics, but the opinion is held by some observers that it and the asthma are due to an unknown common cause. The group of cases in which a definite exciting factor such as hen's feathers can be found appears to be smaller than was at one time supposed.

In a report of progress of the Asthma Research Council, from October, 1927, when it originated to May 31st, 1930,[1] the original programme of research is quoted. This was arranged to cover the whole field as far as possible without overlapping, that is to say the asthma research centres were to attack the problem from different angles, following one line of inquiry in each case. The aspects under consideration were to include biochemical investigation, research into asthma as affecting children, an inquiry into the nature of sensitization, an examination of physical methods of treatment, the relationship of asthma to other respiratory diseases, observations on the effects of diet, an investigation of alleged cures, and an analysis of family histories of asthmatics.

Assistance has been received by the council both as a response to public appeals and by donation from the Hadley Stewart Trust. Persons suffering from the disease have shown much anxiety to further the aims of the council, and have supplied records of their illness and of the treatment from which they derived most benefit. Some of the cures, following years of disablement, offer interesting lines of investigation, in others the importance of the psychological factor in asthma becomes apparent. One man recovered, after sixty years, by taking a mouthful of honey at bedtime, another described a cure following a dose of black treacle after the midday meal and two rhubarb pills at night. The council has wisely included in its programme the investigation of secret remedies and of the claims of homoeopaths, osteopaths, nature curers, and others to treat asthma.

Work at Research Clinics

At Guy's Hospital the clinic is under the charge of Dr. G. H. Oriel, and the staff at work on the asthma problem includes a biochemist a radiologist, an oto-rhinologist, a pathologist and clinical pathologist, a physician, and a psychologist. One would say that with such co-operation it should be possible to view the disease as a whole. The clinic has attempted to collect statistics on the conditions predisposing to asthma, and to institute new lines of research and improved lines of treatment. From 213 patients who have passed through the centre it has been possible to draw some tentative inferences. For example up to 14 years of age asthma is more common in boys than girls, after that age the incidence becomes almost even for the two sexes. Over 50 per cent. give a history of asthma or one of the allied conditions in other members of the family.

Investigations on desensitization to the urinary proteose on digestive symptoms on histamine-producing bacilli in the respiratory passages, and on sensitiveness to feather, hair, and other animal substances are also being carried on, but results are as yet inconclusive. Among 55 patients suffering from asthma associated with other allergic conditions and treated with glucose and ammonia to combat intestinal and liver disturbance 27 had no attacks, 25 were improved (less than 50 per cent. of the original number of attacks), and 3 were unchanged (more than 50 per cent. of the original number of attacks). Among 21 treated by vaccines from organisms to which their skins were sensitive 3 showed no attacks, 13 improvement, and 5 no change. Proteose injection has been tried for over three months on 22 asthmatics on whom other forms of treatment failed, and of these 6 have had no attacks, 12 were improved, and 4 unchanged. These figures give an interesting indication of the value of different lines of treatment.

At Great Ormond Street Dr. G. W. Bray is conducting investigations on children. 300 cases of asthma and allied disorders have been observed during the past year. The family history is taken in great detail, and a health visitor calls at the home and takes note of the district and of the internal and external conditions of the house. A radiograph is taken of the chest, blood specimens for analysis and grouping, and the child's diet and daily routine are considered in detail. Septic foci are removed, routine protein skin tests are made, and test meals given. The children attend educatory breathing classes, especially following the removal of tonsils and adenoids. A paper has already been published in this *Journal* (March 1st 1930, p. 384) on the hereditary factor in asthma, as investigated in 200 cases at this clinic.

Physical methods of treatment are under examination at the London Clinic by Dr. Una Ledingham; these include inhalation therapy, ultra-violet ray therapy, the use of an automatic breathing appliance, and the application of carbon dioxide gas to the nose. Among 40 patients ranging in age from 31 to 70 years, 20 derived benefit from one or other form of treatment, 16 were unaffected, and 4 were made worse. The benefit varied from an hour or two of relief to comparative freedom in a few cases. It was found that the cases associated with bronchitis obtained the greatest relief, the remainder being, for the most part, unaffected. Ultra-violet light treatment appeared to give the highest percentage of improvement, inhalations a slightly smaller percentage, and the automatic breather the least.

At the Glasgow Research Clinic treatment has been confined to the removal of any nasal abnormality and dieting according to Dr. Adams's diet sheet. Investigations are being carried out on the reaction of the blood and on eosinophilia in asthma by Dr. Marjorie Gillespie. At the Asthma Research Clinic at Leeds special attention has been directed to the treatment of nasal sepsis and to non-specific desensitization by the intravenous injection of peptone. The cases have been too few for any generalizations to be made as yet, but Dr. Henderson Moll finds that in his present series inheritance through the mother appears to be twice as common as through the father. At the Birmingham Clinic extensive trial has been made of intravenous peptone, and more recently of calcium chloride following investigations on the ionized calcium in the blood. Voluntary workers at the Edinburgh Royal Infirmary have been collecting data for eight years.

Dr. Una Ledingham has made an interesting report on Continental asthma treatment centres. The treatment at these clinics is largely physical, depending on baths, inhalations, diathermy, and ultra-violet light; the results are good in some cases, but probably are temporary rather than permanent. Dr. Ludwig Hofbauer at Vienna, however, advises a method of re-education in breathing, which is simple and appears to give good results.

Research is a tedious undertaking and cannot be hurried. Investigators have been hampered by lack of funds, but in spite of this a remarkable accumulation of knowledge has accrued.

[1] Copies of the report can be obtained gratis from the Secretary, Asthma Research Council, c/o King's College, University of London, Strand, W.C.2.

BEIT MEMORIAL FELLOWSHIPS.

A SURVEY OF TWENTY YEARS

We have received from Sir James K. Fowler, M.D., trustee and honorary secretary of the Beit Memorial Fellowships for Research in Medicine and Allied Sciences, a report of the last meeting of the trustees, together with details of the Fellows elected on that occasion. In view of the fact that the Beit Fellowships were founded in December, 1909, Sir James Fowler substitutes for his customary annual report a review of the work of the Trust during the first twenty years.

In 1909 there were in England possibly half a dozen studentships and scholarships which would enable a man without independent means to turn aside for a few years from the practice of his profession and devote himself to research in medicine, those of the Grocers' Company deserve mention. Sir Otto Beit's gift of £230,000 was of a magnitude that had no precedent in English medicine, and the annual income derived therefrom has ever since been applied to the endowment of men and women, and none of it has been spent upon the erection of buildings. In its first year the Trust created 10 new Fellowships, and within three years there were 30 Fellows engaged in medical research.

The Beit Fellowships are whole-time appointments, although teaching work in connexion with the allied branch of science is permitted, but private medical practice is forbidden. They are open to graduates in any faculty in a British university. The candidate selects the subject of his research, and in submitting it gives an account of his previous career and names referees who can give evidence of his fitness for the work.

At first the value of a Fellowship was £250 per annum, and the tenure three years, with a possible extension to a fourth year in cases where marked distinction had been shown. In 1922 the Fellowships were reorganized and designated junior (three years), fourth year, and senior (three years), thus providing for seven years of continuous research, a period regarded as adequate for a man of marked ability to give proof of his fitness for a higher post—for example, a professorship. The values of the Fellowships were then fixed at £350 per annum for junior Fellows, £400 for fourth year Fellows, and £500 for senior Fellows. In 1927 the stipends were again revised and increased to £400, £500, and £700 respectively, at these values they have since remained.

In 1927 a Senior Fellowship, value £1,000 per annum for five years for research in tropical medicine, was created. To this Dr. Edward Hindle, whose research on yellow fever has been referred to in favourable terms in recent annual reports, was appointed. This research has already afforded an answer to several questions of great practical importance in connexion with yellow fever. It has been shown that (1) A vaccine prepared from the organs of monkeys of a certain species infected with the virus of yellow fever will give protection to other animals of the same species. (2) That animals thus protected can withstand a dose of the virus a million times as great as that which is fatal to the unprotected. (3) That, although this vaccine prepared from monkeys is protective to monkeys, it has not yet proved possible by similar methods to immunize human beings. (4) That Europeans may suffer from a mild disease not clinically recognizable as yellow fever, and that subsequent examination of their blood may prove that all the accepted tests of immunity are present. In view of the dangers of this work the Trustees have decided not to continue the research under present conditions.

The total number of Fellows elected up to and including 1930 is 138. But for the war this number would have been greatly increased, as in 1914 all the Fellows resigned in order to undertake work of more immediate national importance, and during its continuance no new appointments were made. In 1919 all those who applied were reinstated.

Careers of Beit Fellows

Excluding those whose appointments are of too recent date to justify their inclusion, it appears that the total number of Fellows elected up to the year 1925 was 101, of whom 79 were men and 22 women; of the men, 7 died at a relatively early age, but none of the women.

Considering first the careers of the 72 men, it appears that 4 have received the F.R.S. and 16 have been appointed to university professorships. Most of the remainder occupy whole-time posts for teaching, research, or scientific work, and have steadily continued the career upon which many entered when first elected to a Beit Fellowship. Of the 52 who held medical qualifications when appointed, 13 have passed into medical practice, consulting or otherwise, but the majority of these are continuing scientific work and are thus influencing the character of the men in which they are now engaged.

Of the 22 women a few have married, but all continued for many years the work of research, and many are still thus engaged. That they hold, or have held, such positions as members of the scientific staff of the Lister Institute, university lectureships in biochemistry, pathologist and bacteriologist to general hospitals and boards of health, head of a department in an institute for medical research, principal of a horticultural college, physicians to children's hospitals, and holders of Rockefeller Medical Fellowships, is sufficient proof of the value to them of their training when engaged in research as Beit Fellows and also of the services they were thus enabled subsequently to render to the community both in this country and abroad.

As the separate problems upon which the Fellows have been engaged exceed 180 in number it is unlikely that any single individual is competent to form a trustworthy estimate of the effect which this work, covering so many and such diverse fields of knowledge, has had upon the advances made by these various sciences during the period in question. The honorary secretary mentions, however, by name two former Fellows, both of whom were appointed at the first election in 1909. "During the last fifteen years England has made no more conspicuous contributions to the knowledge that guides practical medicine than those which lie in the analysis of disorders of the heart by Sir Thomas Lewis, F.R.S., and in the experimental proof that rickets is due to vitamin deficiency by Professor Edward Mellanby, F.R.S."

Although the possession of an adequate stipend is the first necessity for one who proposes to devote his life to research, a place wherein his work can be carried on is hardly less so. The Beit Fellows have been singularly fortunate in this respect, they have been welcomed in many laboratories and institutes not only in this country but on the Continent and in America. In particular, many have enjoyed the hospitality of the Biochemical Laboratories at Cambridge under Sir F. Gowland Hopkins, and of the Lister Institute under Sir Charles Martin.

In the opinion of the Advisory Board the founder has every reason to be satisfied with the results obtained during the first twenty years of the life of the Trust which was born of his munificence in 1909.

Elections to Fellowships

The following elections were made by the Trustees:

Senior Fellowship (value £700 per annum).—Richard James Lythgoe, M.A., M.B.

Fourth year Fellowships (value £500 per annum).—(1) Philip Eggleton, M.Sc., (2) Frank Robert Winton, M.A., M.D.

Junior Fellowships (value £400 per annum).—(1) Frederick Horace Smirk, M.D., M.R.C.P., subject the functional pathology and physiology of diuresis from a biochemical standpoint and the functional pathology of plethoras, anaemias, and oedemas, (2) Gordon Roy Cameron, M.B., B.S., D.Sc., subject the histological identification of calcium salts in pathological deposits and inflammation in invertebrates, (3) John McMichael, M.B., Ch.B., M.R.C.P.Ed., subject the interrelationships of liver and splenic disease, diseases of portal vessels and other vessel changes in liver disease, (4) Robert Percival Cook, B.Sc., Ph.D., subject bacterial metabolism and its relation to the specific action between host and bacterial parasite, (5) Norman Urquhart Meldrum, B.Sc., subject the so-called reversible denaturation of haemoglobin and the formation of sulphydryl groups in various types of protein denaturation, (6) David Reginald Piper Murray, B.A., subject a comparison of the two types of proteolytic enzymes characteristic of the tissues and organs and of the digestive tract, (7) George Norman Myers, M.B., B.S., M.Sc., subject the curative action of digitalis, its glucosides and allies, in general toxaemia and in conditions of shock, (8) Charles Amos Ashford, B.A., subject studies in (*a*) the metabolism of nervous tissue and (*b*) the mode of action of vitamin D, with special reference to hypervitaminosis D.

All correspondence of candidates and Fellows should be addressed to Sir James K. Fowler, honorary secretary, Beit Fellowships for Medical Research, 35, Clarges Street, Piccadilly, W.1.

Nova et Vetera.

ANAESTHETICS IN MIDWIFERY

J Y SIMPSON'S APOLOGIA

A few months ago a fund was started for the purpose of providing anaesthetics to necessitous women in labour In 1847, when Professor J Y Simpson gave the first anaesthetic to a woman in labour the practice which the public is now asked to support was condemned on medical ethical and religious grounds The contrast may serve to underline the impermanence of moral codes it must not be taken to prove that we are better than our fathers We do not, it is true oppose the administration of anaesthetics in midwifery, but we might well ask ourselves how we would react to this practice if it were proposed for the first time to-day, or whether some of the innovations now opposed on moral grounds may not be adopted and regarded as blessings by our descendants The arguments that Simpson had to answer have more than a historical interest they have appeared with very little change in more recent controversies, and will doubtless find their supporters in the controversies of the future They are, indeed, the stock-in-trade of those persons who, mistrusting innovations for no better reason than that they are new, seek to base their opposition on loftier grounds than a mere temperamental conservatism

Fortunately, Simpson was a skilled dialectician and courageous enough to meet his opponents on their own ground the doctors he refuted by arguments based on medical experience, the theologians out of the Scriptures Some idea of his polemical methods may be gained from the following passages that appear under the heading "Notes of Professor Simpson's Lectures on Midwifery, 1854 to 1855," in the notebook of Dr William Oxley who was a student at Edinburgh, where he qualified in 1856 [1]

The religious objection is that it is a direct interference with the primal curse But if we read the curse literally we must take the whole of the context We shall then find that we are no more interfering with the primal curse in giving a woman chloroform in labour than by eating our food without sorrow, for it says in the curse to man, 'in sorrow shalt thou eat of it all the days of thy life , or by weeding our gardens for it says further, 'thorns and thistles shall bring it forth to thee' , or by inventing agricultural machines to save the sweat of man's brow This argument against chloroform is chiefly used by old maids. In answer we can remind them that the primal curse ordains, I will greatly multiply thy sorrows and thy conception and then ask them, Where is your conception, you've been breaking the primal curse? In sorrow thou shalt bring forth children, you have not any, and, Thy desire shall be to thy husband Madam, you haven't one

Our best Hebrew scholars say that the word in this passage translated sorrow is everywhere else rendered toil, and where pain is meant quite a different word is used According to this argument all medical men are very great sinners for spending their lives in combating death, another consequence of the curse, and parsons are infinitely worse for striving to do away with sin.

The arguments based on ethics Professor Simpson dealt with as follows

Moral objections are made on the ground that it is an unnatural interference with natural functions The same argument holds good in regard to all the inventions and improvements which have removed us from the state in which we were placed by nature. If we take away every thing that is unnatural we shall speedily find ourselves stark naked, *in puris naturalibus*, without carriages, clothes, steamboats, railways, and all the comforts of life Besides, the black women who as nearly as possible are still in a natural condition, suffer little or no pain in labour consequently, when we give a woman in labour chloroform to lull her pains, so far from putting her into an unnatural state we, on the contrary, restore her to a more normal condition.

As was only fitting, Simpson, in lecturing before medical students, devoted the greater part of his attention to the objections that had been brought forward by his professional brethren The gist of his argument is shown in the following extracts

All innovations, not only in medicine but in other professions have met with the strongest opposition It is said that the sexual feelings are excited by the use of chloroform but this is not true the same argument was used against potatoes, tea, and coffee It was always considered by the older surgeons that pain was a great drawback to surgical operations and that something to render patients insensible to pain was very desirable as the suffering of a patient from a severe injury depresses the system, and is alone sufficient to destroy life affecting the circulation in the same way as convulsions do, with fatal effect But no sooner have the anaesthetics so long desired, been discovered, than the opponents to their use say that pain in surgical operations and in midwifery is desirable According to them pain is a very nice thing, they think old things are better than new Shortly after its discovery I stated in the Medico-Chirurgical Society that statistics alone could settle the question these show that operations are not so fatal to the patient on the table when we save him from the pain by giving chloroform and that it adds greatly to the chance of his life being saved after the operation The same doctrine has been held with regard to midwifery, it is said that pain is an essential element in labour It is no more essential than in surgery and patients get on much better without it than with it

In the practice of our profession we have two great duties to perform to prevent death and suffering When we forge either we forget half our profession. All other pains have their remedies, and we have as much right to relieve the pains of labour as other pains, particularly as labour pains are more severe than any of them we are quite as much bound to relieve one as the other

It is said that anaesthesia sometimes produces very serious symptoms vomiting is one but this is not serious and is very rarely seen under the use of anaesthetics Laughing often comes on, but this is not more serious than in hysteria Others aver that it produces convulsions spasms, haemorrhage, but these complications, so far from being caused by it, are more generally treated with it successfully Another objection is that it leaves mental and bodily diseases, such as pneumonia, bronchitis pericarditis, fever, and puerperal diseases It was supposed to produce bronchitis and pneumonia from these diseases being found in those patients who died after surgical operations after its use but when patients die after operations these are very common causes of death, whether anaesthetics have been used or not The proportion of deaths from this cause is not so great after their use as without them

It has been said to cause pericarditis because old adhesions have been found in the pericardium of people who have died under chloroform but old adhesions could not form during the few minutes occupied in the inhalation.

Feverishness is far less frequent after the use of chloroform than without it It is said that it is apt to leave disease of the mind I have seen its use followed by puerperal insanity but only in women who have suffered from this disease before when chloroform had not been used, and consequently it cannot be attributed to chloroform I know of one case of a lady who had always had puerperal fever in previous labours in which chloroform was not used in succeeding labours in which it was used she was quite free from it

It has been asserted that it stops uterine action by producing paralysis. If given during the intervals between the pains it certainly will arrest the pains most effectually, but it will not do so if given during the pains, which is the proper time for giving it and withdrawn during the intervals

Another objection is that it occasionally destroys the life of the patient It has occasionally produced death in surgery but this accident has never happened in midwifery because it is given in much smaller doses On this ground we ought to reject all the drugs from the *Pharmacopoeia*. Opium alone produced 240 deaths in one year even when medically employed In about 400 000 cases chloroform has been used in Edinburgh and out of these there has only been one death Is there any drug in the *Pharmacopoeia* which has been used with less deleterious results? Many ordinary practices in common life should be abolished on the same ground bathing because people have been drowned cold water because people have died from drinking too much of it Fire and water occasionally destroy life should they be abolished? All medical practices, when not used properly may cause death and to give them up from their abuse and not from their use would be madness Since 1847 chloroform has been used in almost all surgical operations performed in Edinburgh, perhaps not more than 5 per cent being performed without it, and only one death has occurred under its use During the same time four cases of sudden death on the operating table have occurred in which chloroform was not given. If chloroform had been used in these cases the deaths would have been attributed to it.

[1] We are indebted to Dr W H F Oxley son of William Oxley for his kindness in allowing us to publish extracts from his father's notebook.

Many women look forward to their term of confinement with dread, which is entirely removed by these remedies Some women, particularly when maniacal, will not allow an examination to be made a difficulty which is removed by anæsthetics

It alleviates the pain of natural and morbid labour, which it is as much a duty to do as to relieve the pain of toothache, lumbago, or any painful disease, all of which have their appropriate remedies, and are not so bad as that of labour It is of use in facilitating manual and instrumental delivery it assists us in turning, by arresting the action of the uterus and in extracting retained placenta, it is the only remedy which arrests convulsions, it promotes recovery which is much shorter and safer after its use in consequence of which the nurses are set at liberty much sooner, a great objection on their part It facilitates puerperal operations, abscess of the mamma often multiple, can all be opened at once, and often disappears in a week instead of going on for months

The modern historian engaged in handling great men out of the pages of history, his favourite recreation, must pause a little uneasily when it comes to the turn of James Young Simpson Would the general adoption of anæsthesia in midwifery have been delayed, he must ask himself, and for how long, if Simpson had been a man of less genius, less skilled in controversy, and with no stomach for a fight?

PUBLIC ADMINISTRATION AND THE MILK SUPPLY

[FROM A CORRESPONDENT]

The wholesomeness and cleanliness of the milk supply of this country are of such evident importance that the chaotic state of the legislation now in force is greatly to be deplored Probably the most glaring example of this chaos is to be found in the overlapping and uncertainty which exist, except in county boroughs, as to the respective duties of the county councils on the one hand and the sanitary authorities (borough and district councils) on the other The adulteration of milk—for example, by the addition of water or skimmed milk or preservatives or colouring matters, or by the abstraction of fat—is the primary concern of the food and drugs authority, which, in the urban and rural districts, and many of the municipal boroughs, is the county council, but medical officers and sanitary inspectors of sanitary authorities may also undertake administrative duties in connexion with such adulteration if they wish This, however, involves their authority in the obligation to defray the cost of their work without escaping its contribution to the cost of the county council's administration of the Food and Drugs (Adulteration) Act

Whether or not the sale of dirty milk is an offence under that statute, and thus a matter with which a county council should concern itself at all, is a question on which this Ldo not agreed The county council of Middlesex, in a circular recently issued to its [illegible] authorities in the county, makes it clear that the officers of that council do not consider that it is within their province to attempt to apply the Food and Drugs (Adulteration) Act to dirty milk, and that in the county council's view local sanitary authorities should take an interest in the matter by virtue of their powers under the Public Health Acts and the Milk and Dairies Order of 1926

Specially designated milk—that is, milk sold under such descriptions as Grade A tuberculin-tested, or Certified—is dealt with by the Milk and Dairies (Amendment) Act, 1922, and the Milk (Special Designations) Order, 1923 under which food and drugs authorities and local sanitary authorities have some powers definitely assigned to each, and others which they may exercise concurrently An example of concurrent powers is to be found in connexion with the enforcement of Section 3 of the Act of 1922, which forbids the sale of specially designated milk otherwise than in accordance with the terms of a licence Local sanitary authorities and county councils are alike empowered to set the law in motion against a distributor licensed by the local authority, and the Middlesex County Council now points out that although in two recent cases it instituted prosecutions it does not ordinarily take such action, but leaves administration in the hands of the local authority, which alone can revoke a distributor's licence With regard to milk from tuberculous cows, the position is further complicated, by reason of the fact that the Milk and Dairies (Consolidation) Act of 1915 and the Milk and Dairies (Amendment) Act of 1922 (which were not originally intended by the Ministry of Health to be in force simultaneously) are both in fact operative, and while Section 5 of the former Act is to be enforced by county and county borough councils, Section 5 of the later Act is to be enforced by sanitary authorities, and each of these sections forbids the sale of milk from cows suffering from tuberculosis of the udder

In these circumstances it is hardly to be wondered at that there is no great uniformity of practice among the various classes of local authority, or that some county councils arrange for the regular collection and routine examination for tubercle of samples of milk while others do not When two authorities have concurrent powers there must always be a danger that each will leave the work to the other Except in connexion with the veterinary inspection of milch cows for tubercle, and Grade A milk sold by licensed producers (as distinct from mere distributors) it would seem that county councils have no clearly defined duties with regard to the sale of milk (or any article of food) which is not, from the point of view of cleanliness or bacterial content, wholesome and sanitary But the annual reports of medical officers of sanitary districts do not, as a rule, provide much evidence that the sale of dirty milk or of specially designated milk has been closely supervised, and there is perhaps in some areas a tendency to regard the supervision of the milk supply as in all respects the province of the county council

In Scotland, by the Local Government (Scotland) Act 1929, all the duties of burghs with a population not exceeding 20,000 under the Food and Drugs and Milk and Dairies Acts have been transferred as from May 16th, 1930, to the county councils which makes the administrative position in Scotland much simpler and cleaner than it is in many parts of England and Wales, with regard both to milk and to other articles of food

ROYAL MEDICAL BENEVOLENT FUND

DURING the first six months of this year the committee has voted £5 208 in grants in addition to the usual payments to the annuitants These grants have been made to medical men who, through age or infirmities, have been unable to follow their profession and whose savings have been exhausted, to widows who have been left ill provided for, and even in some cases absolutely destitute, to widows left with the heavy responsibility of children to educate, and to other dependants of medical practitioners All are genuine cases of distress and poverty, and deserving of the helping hand of a colleague, but more colleagues willing to give the help are wanted Subscriptions and donations are needed Cheques should be sent to the honorary treasurer Royal Medical Benevolent Fund, 11 Chandos Street Cavendish Square W 1

At the last meeting of the committee £646 was voted to thirty five applicants The following are examples of the cases helped

Widow, aged 43 of L.R.C.P and S Husband died in November 1929 of tuberculosis contracted during the war He gave up his town practice three years ago in order that he might work in the country He was however, unfit to do much work and such practice as was secured is not now saleable The widow has been left with £150 in the bank and no income, and a boy aged 10 to educate Fund voted £26 and the committee has asked the Guild to assist widow to find employment The boy will be a candidate for Epsom The Fund will keep in touch with the case will ask other charities to assist, and will give further help from time to time

M.R.C.S aged 57 owing to a stroke had to give up work and is too ill to attend to his own affairs The wife applied for help towards the education of the two children Private income £200, it is not expected that the practice will sell for more than £650 Boy, aged 15, has one more year at school to finish, fees £120 Girl aged 12 at school fees reduced to £30 a year It is of the greatest importance that the boy should have his final year at school, after which he will be able to earn Fund has agreed to pay £45 towards boy's school fees and will ask other charities to contribute towards the balance required

Daughter, aged 61 of M.R.C.S Has been employed in an office but has been seriously ill for many weeks Sick pay of 12s. a week ceased on May 8th She has now only £30 a year from another charity Medical report stated that it would be a long time before she could hope to resume work This was a case of very pressing need and urgency Voted £18 to be paid during the next six months when the case would be further considered In the meanwhile medical comforts and service will be provided by the Guild

The Royal Medical Benevolent Fund Guild still receives many applications for clothing, especially for coats and skirts for ladies and girls holding secretarial posts, and suits for working boys The Guild appeals for second hand clothes and household articles The gifts should be sent to the Secretary of the Guild, Tavistock House (North), Tavistock Square, W C 1

British Medical Journal.

SATURDAY, JULY 26TH 1930

SCIENCE AND METHOD

SCIENCE in its chief aspect is a process of gaining knowledge and as such it must not be confounded as it so often is with the process or processes of collecting facts We are far from suggesting that collecting facts is not a laudable activity, it may provide science with material, but itself it is not science The true scientific process is concerned with the arrangement and classification and interpretation of facts, with finding sequences and similarities with formulating hypotheses with discovering law it is a creative act a play of the intellect and imagination about facts, which transforms barren information into fertile knowledge In this process method—that is the way in which facts are discovered—has an important but secondary place It varies from science to science, and within each science according to the material that is being studied, and it may be said to have scientific value in so far as it is adapted to the material being studied and to the ends the scientist has in view It is very important to realize the significance of this second criterion The scientist does not, as it were, take a random sample of facts and say Here is Nature, what secrets has she to reveal to me? He asks specific questions, and has to find the answers in known facts, or to look for the new facts which he believes will provide the answers If his questions are about matters in the field of chemistry and physics he will probably seek out the relevant facts by the method of experiment, if about astronomy or geology it will depend on the precise nature of his questions whether experiment or large scale observation will serve him best It is worth bearing in mind for it may correct the prevailing tendency to over value the experimental method that the scientific theory which has had a greater influence than any other in determining cultural development in the civilized world—the theory of evolution by natural selection—was built up by the method of observation though the credit belongs not to the method, but to the genius of the man who applied it

The experimental method has served science so well that there is, indeed some excuse though no rational basis, for the common view that science is experiment and—an obvious corollary—that knowledge gained otherwise than by experiment is not scientific Even in medicine a subject which has never found a comfortable place among the sciences and prefers generally to proclaim itself an art based on science there is a tendency to apply the word scientific only to facts elicited by laboratory methods or by the method of experiment, other words empirical " for example, being reserved for the facts elicited by the method of observation There is it appears caste among facts and empirical facts are somehow of a humbler order than those named scientific How a fact is classified which has been discovered independently by two opposed methods is not quite clear but the question may serve to indicate the kind of difficulty that can arise when science and method are not clearly distinguished from each other All confusion we believe could be avoided if two general principles were kept in view first, that neither experiment nor observation is science, but that these methods like all others may be used scientifically or otherwise secondly that facts in themselves are neither scientific nor unscientific but thinking makes them so

These considerations bear closely on the thesis developed by Mr Wilfred Trotter in his paper on observation and experiment and their use in the medical sciences This paper published at page 129 should be read in conjunction with Sir Thomas Lewis's observations on research in medicine (*British Medical Journal* March 15th p 479) for in a very real sense the views of these distinguished workers are complementary to each other The indolent mind rests on antitheses, on the easy assumption that if this is good then that must be bad, it must favour observation or experiment—it cannot favour both Sir Thomas Lewis and Mr Wilfred Trotter take, as might be expected, the far more difficult course of appraising the merits and limitations of both methods, and if ultimately one comes down more heavily on the side of experiment and the other on the side of observation it is only, we think because they are not concerned with exactly the same material Behind much of the controversy on the problems of method may be perceived this subjective factor—the all too human bias of the protagonists in favour of methods adapted to the kind of phenomena they themselves are engaged in studying In every concrete instance brought forward to illustrate how *this method or that has served to advance knowledge* it is evident that the method has been successful because it has been correctly applied to suitable material In the sciences related closely to medicine the experimental method has its chief application in the fields of biochemistry physiology, and bacteriology But there is at least one field of medicine that can only be investigated satisfactorily by the method of observation we refer to prognosis It has been said that in medicine three things are important, and that the first and second and third of these is diagnosis But diagnosis is not everywhere in good favour It has been described as the application of labels, though even if it were no more than that we should think little the worse of it, the application of the right label is no small feat, and to those who know how to read it right the label is a shorthand description of the patient and of the disease process from which he is suffering But no one can afford lightly to dismiss prognosis Prognosis rests on a knowledge of the dynamism of disease of the constitution of the individual, and of the nature of the environmental influences, pathogenic or otherwise to which he is subjected This is knowledge that can be gained only by the application of the method of observation to the study of individual patients

Ultimately it may be said indeed that all advance in the science and art of medicine can be gained only at the bedside or in the clinic This does not mean that the physician is not indebted and likely to go on being indebted to knowledge gained by laboratory workers and by workers using experimental methods Such knowledge helps to direct his observation into fruitful channels, it serves, moreover to correct the errors into which he is liable to fall from too exclusive a dependence on the method of observation But none of this knowledge is an advance in medicine until it has been studied in relation to real patients and put to the crucial test of everyday practice

A NOTEWORTHY HEALTH SURVEY

PHILADELPHIA, with its population of over two millions, is one of the largest cities in the United States, and its government and public medical arrangements are of universal interest. It is a city which has had distinguished health superintendents and is the seat of important medical teaching, but "politics" in the worse American sense have meant a vast amount of misgovernment and confused government in the past. There was need, therefore, for the comprehensive survey of its medical activities[1] to which Dr. Haven Emerson's leadership lends credence and authority. The inquiry was authorized by the mayor of the city, and all official documents were made available, it was backed by a Citizens' Survey Committee, and it was supported by a large number of representative subcommittees making studies of special problems within the general scope of the report. On the side of the Health Services, subcommittees considered the problems of cancer, of dental diseases, of heart diseases, of mental hygiene, orthopædics, tuberculosis, maternity and child welfare, social hygiene, sanitation, public health education, industrial hygiene, health services, health examinations, and health areas, and on the side of Services for the Sick, separate subcommittees considered hospitals, dispensaries, social service, convalescence, the chronically sick, and home nurses. The total cost of the survey was about 70,000 dollars, or 3·4 cents per capita if distributed throughout the population, and there is little doubt that the report amply justifies this expenditure.

From an English standpoint, one wonders why, if as we believe is the case, the information in this volume is not available in the periodical reviews of the health superintendent. Annual stocktaking is as important in respect of the health problems of a city as is the treasurer's annual statement of its finances. But even in an English public health report much of the information as to the activities of general and special hospitals given in this volume would be lacking. With the extended local government in England, and the fusion of public health and Poor Law medical activities this should approach more nearly to realization, but the annual review will still be incomplete until it gives corresponding and comparable data for all non-official institutions of the sick, such as are embodied in some measure in this report on the Philadelphia survey. In the report is quoted a comparative statement for the year 1923 of per capita expenditure in cents in twelve American cities with population exceeding half a million. Philadelphia stands lowest in this list with 42 cents, Boston (87 cents) standing highest. In 1928 Philadelphia had increased its per capita expenditure to 52 cents.

In the space at disposal only a few points bearing on public health work can be noted. The chief obstacles to improvement are the inadequate allotments of funds for public health work, the imperfect co-ordination between different public health activities, and especially perhaps in the relation between voluntary and official public health work. A particular instance of the American tendency to have paper regulations which do not carry with them the weight of public opinion is seen in the notification of cases of venereal disease. These are fewer than the number of cases treated in the Philadelphia General Hospital. Delinquent cases not continuing treatment while in an infective condition are liable to have a placard labelled "venereal disease" printed in bold letters placed at the entrance to the patient's home; but, we are informed, "it is rarely necessary to placard a house."

Philadelphia, like all American cities, shows a rapid increase in accouchements in hospitals. In 1921 these formed 31·2 per cent. of total live births, in 1928 the proportion had increased to 51·3 per cent. Of the total live births in 1921, medical practitioners attended 55·0 per cent. of those delivered at home, in 1928 this had declined to 42·9 per cent., while the reduction in midwives' cases was from 13·8 to 5·9. Evidently the maternity practice of both doctors and midwives is being gradually transferred to institutions. Mortality of mothers from accidents and complications of pregnancy and parturition is high, being over 7 per 1,000 live births, as compared with about 4 to 5 in Great Britain. The infantile death rate varied in 1928 in different wards of the city from 276 to 41 per 1,000 births. It is nearly twice as high in the coloured as in the white population. What a vast scope for preventive effort is symbolized by these figures! And yet admirable work is being done, which if adequately co-ordinated and controlled might have double its present effect. Philadelphia is the home of the Henry Phipps Institute, the research work of which on tuberculosis is world famed, but on the administrative side it is lamented that voluntary and official efforts overlap and function inadequately in outlying districts, and the methods of medical and social help are sadly divergent and unrelated. In regard to crippledom there is a like need for overhauling such activities as exist, and for their systematic extension, and the same remark may be made concerning the provision for home visiting of mothers and infants and of the sick, although by some societies good work is being done in these respects.

We need not pursue our illustrations. On the public health side the outstanding lesson of the survey is the need to "take stock," to bury the interests of individual societies and organizations in a spirit of co-operation, and to join forces with official agencies in a combined effort to secure the maximum benefit to the community from every dollar which the taxpayers and the charitable public would then, with increased willingness, be prepared to give. The hospital section of the survey embodies much valuable information, but here—and this feature is seen in large cities both in Europe and in America—there is very incomplete co-ordination between the work of different hospitals. General hospitals are burdened with chronic patients for whom their facilities are unsuited, and at an excessive expense. The homes for chronic cases are overcrowded, and have long waiting lists, and negroes particularly are neglected. The inadequacy of provision is shown by the following comparison. In hospitals intended for the chronic sick Boston had 2·3 beds per 1,000 of population, while Philadelphia had 0·48 bed, and in general hospitals there were 1·3 beds per 1,000 of population for chronic cases, as compared with 0·25 in Philadelphia.

We have extracted only a few items from a document of great value. The entire report is deserving of study, and is most instructive. We congratulate Dr. Haven Emerson and his colleagues on its successful production, and wish for it the practical results that should follow. These will probably come gradually. Their advent will be hastened if all agencies for the betterment of the people endeavour at once to join forces with those whose work is most nearly allied to them. A process begun in this spirit will soon extend. The need for municipal reform is obvious. A wealthy city—and a poor city none the less—cannot afford to

[1] *Philadelphia Hospital and Health Survey 1929.* By Haven Emerson, M.D., Sol Lincus, C.E., and Anna O. Phillips. Philadelphia: Philadelphia Hospital and Health Survey Committee. 1930. (6 × 9; pp. xxii + 834.)

throw away human life and health in the manner which incomplete and unsatisfactory public health administration especially on its medical side implies The citizens of Philadelphia are responsible in the final issue if they do not insist on wisely directed effort, on extended official work and on efficient co-operation of this with all voluntary agencies and hospitals

THE INTERNATIONAL CONTROL OF DRUGS OF ADDICTION

THE British Government has just issued its report for 1929 to the League of Nations on the system of control of the commerce in dangerous drugs established in this country by the Acts of 1920–25, which were the outcome of the International Opium Convention signed at The Hague in 1912, and implemented by the Geneva Convention of 1925 The report claims that "drug addiction is not prevalent in this country," that the production and export of morphine and heroin have been reduced in comparison with the previous year, that raw opium for medicinal purposes is now mainly derived from India, and that the use of "prepared opium" is totally prohibited in Great Britain Some 70 persons were in 1929 proceeded against for offences under the Dangerous Drugs Act, 34 were imprisoned, 26 fined, and a few were deported Since 1928 cocaine has been manufactured, under licence, in this country by one firm, and 9,326 ounces were produced last year, 3,920 ounces were exported, and 4,329 ounces imported The latter is some 5,000 ounces less than in 1928, and the home produce is increased by about the same amount While illicit traffic in dangerous drugs in this country is said to be on a "very small scale," seizures of opium, morphine, heroin, and cocaine, in some cases of enormous amounts, are reported to the League of Nations from abroad Returns from India, Egypt British Colonies, and America indicate that there is little, if any, reduction in the illicit commerce Cases are cited to show that Amoy in China is a centre for smuggling drugs into India and elsewhere At the fifty-ninth Council of the League of Nations, held in May last, the British representative emphasized the widespread and dangerous character of the illicit traffic He cited the case of a steamer that had recently left a port of a certain producing country carrying two thousand cases of opium entirely destined for illicit traffic The Council endorsed the desire of the Tenth Assembly that steps should at last be taken to limit the production of dangerous drugs to medical and legitimate requirements Such limitation was implied and approved by Article 9 of The Hague Opium Convention of 1912, and was reproduced in Article 5 of the Geneva Convention of 1925 It has, indeed, been argued that such limitation should apply only to the alkaloids derived from opium and to cocaine, together with preparations made from them, and not to raw opium nor, for a limited period, to the traffic in "prepared opium" in the Far East The case cited above by the British representative would, however, appear to justify the contention that limitation to medical and legitimate purposes must be applied equally to the production of opium itself The Advisory Committee at Geneva is to be reinforced by the addition of new members, and a fresh conference is to be assembled in December next, which will include representatives of consuming as well as of producing countries Meanwhile it would appear that other countries which are parties to The Hague and Geneva Conventions would do well, not only to legislate on the lines of our Dangerous Drugs Acts 1920–25, but also to see that such legislation is effectively administered

FURUNCULOSIS IN FISH

IN July, 1929, the Secretary of State for Scotland and the Minister of Agriculture and Fisheries appointed a committee, under the chairmanship of Dr T J Mackie professor of bacteriology at Edinburgh, to investigate furunculosis in fresh water fish in Britain The first interim report has just been published[1] The disease is not a new one It has been known in Europe for at least forty years and the causative organism, *Bacillus salmonicida*, was identified in 1894 The condition did not attract attention in this country until 1911, however, but since then it has caused considerable alarm among those concerned with fresh-water fisheries, and it appears to be becoming more common This fatal epizootic disease of the Salmonidae was designated furunculosis by analogy with the human condition, in virtue of its characteristic "boil-like lesions" The causal organism is a short, acrobic, non motile non sporing, Gram-negative bacillus which is not pathogenic for mammals and birds, but is highly virulent to frogs and many species of fresh-water fish The organism can be readily isolated from the heart blood and kidneys, it causes boil-like lesions involving the skin and underlying muscle only in a minority of specimens Healthy carriers appear to exist Recent work has shown that the boil-like lesions are not analogous to human furuncles they are areas of necrosis without any cellular reaction, and the "pus" is really only a mixture of muscle fibres, blood cells, and bacteria The disease is essentially a septicaemia, and various organs may be involved, it is a serious economic menace to the salmon-fishing industry in Britain, and is still spreading to previously uninfected rivers The committee inclines to the view that fish farms play an important part in this spread It is recommended that no live fish belonging to the Salmonidae should be imported from abroad, and that all others, except eels for human consumption, should be admitted only under licence Outbreaks at home should be made notifiable, and no fish should be transferred from an infected watershed without permission from the appropriate authority There is still much to be learned about the disease, however, the experiments at present in progress are to be continued and extended both in the laboratory and in the field

PREMATURE BURIAL

ON June 19th Dr Gardiol, Deputy for the Basses-Alpes, in conjunction with certain of his colleagues, deposited in the Bureau of the Chamber of Deputies in Paris the following draft resolution "The Chamber invites the Government to regularize, in accordance with the findings of the Academy of Medicine and of the Academy of Sciences the verification of death by a medico-scientific test unequivocally indicative of death, in order that the number of burials of persons apparently dead may be reduced to the lowest possible minimum" Dr Gardiol, in assuring his audience that the fear of being buried alive was well grounded called to witness the many cases of premature burial on record In particular he cited the case of Cardinal Donnat, Archbishop of Bordeaux who, on the occasion of his ordination at Rome, passed into a state of apparent death and was wrapped in a shroud and carried to church where he remained unconscious in his coffin till he was awakened by funereal chanting Dr Gardiol's resolution, which has been referred to the Commission on Hygiene, has, of course, proved excellent copy for the Parisian press An editorial note in *Excelsior* points out that in 1803 Fourcroy, wishing to incorporate a provision in the *Code Civil* to the effect that the official called in to verify death should be

[1] Interim Report (March 1930) of the Furunculosis Committee. Edinburgh H.M. Stationery Office. 1930. 3s. 6d. net.

accompanied by a doctor, was assured that he had asked for the impossible, so small was the number of available doctors That objection to-day has ceased to be valid, and it would almost seem as though Dr Gardiol's proposal has a reasonable chance of being translated into French law The whole question was dealt with very thoroughly in Germany in 1919 and 1920 in connexion with the case —discussed fully in the *Deutsche medizinische Wochenschrift* by Dr Puppe, professor of forensic medicine in Konigsberg—of a nurse who, attempting to commit suicide with 1·7 grams of morphine and 5 grams of veronal, was apparently dead for over seventeen hours Puppe's survey included a reference to a Prussian law of 1775 dealing with pecuniary rewards for the revival of persons apparently dead Successful operators received 30 marks, those who had striven in vain were awarded a consolation prize of 15 marks Under certain conditions the prize was divided equally between all the operators The legislators foresaw the possibility that the revival of the apparently dead might become organized as a large-scale industry, and accordingly applicants for the rewards had to prove that the object of their care had really been apparently dead, and that their efforts on his or her behalf had been sufficiently strenuous As a further safeguard against the creation of a trade in resuscitation, cases of poisoning were excluded from the prize-winning class Doctors were eligible for the reward, provided that they were not medical officers of prisons

PREVENTION OF MILK FEVER

ON July 12th (p 69) we published a brief account of a study in the prevention of milk fever that has been carried out at the Royal (Dick) Veterinary College, Edinburgh, and the Animal Diseases Research Institute, Moredun This work, we are informed by Professor J Russell Greig, Director of the Institute, was conducted jointly by himself and Professor Henry Dryerre of the Departments of Physiology University of Edinburgh, and the Royal (Dick) Veterinary College, and Dr N C Wright, by the aid of grants received from the Development Commission and the Highland and Agricultural Society of Scotland, and forms part of a general investigation on milk fever which these workers are prosecuting in collaboration As many of our readers will be aware, the physiological theory which forms the basis of these investigations was originated by Dryerre, who himself initiated the biochemical investigations and conducted them in their early stages Dryerre and Greig contributed a paper on the etiology of milk fever to the *Veterinary Record* on September 8th, 1928, and the paper entitled 'Studies in the prevention of milk fever," which formed the basis of our annotation, was contributed by Greig to the same periodical on April 5th, 1930

THE B C G DISASTER AT LUBECK

ON June 14th (p 1103) we gave a brief account of the conclusions derived by Professor Bruno Lange from his investigations of the deaths that took place at Lübeck following the administration of B C G cultures to 246 infants In an article which appeared in the *Deutsche medizinische Wochenschrift* of May 30th (p 937) Lange stated that he was convinced that the fatalities among the inoculated infants were due to the presence of virulent tubercle bacilli in the cultures In a more recent report Lange states that the experiments and tests carried out by himself and his co-workers at the Robert Koch Institute, Berlin have shown that the material, in the course of its preparation for inoculation purposes, became contaminated, and that the infants were actually inoculated with preparations containing virulent bacilli from some other source He, together with the other investigators, condemns the head of the Lübeck Hospital for throwing away stocks of the cultures when their pathogenic properties became known, for by this action material indispensable for a complete investigation of the cause of the outbreak was destroyed It will be recalled that the citizens of Lubeck appointed their own commission of inquiry, this commission has now issued a majority and a minority report, the former being more severe in its strictures on those responsible According to the majority report the doctor whose duty it was to prepare the vaccine placed the B C G cultures in an incubator containing virulent cultures of human tubercle bacilli, and failed before the vaccine was administered, to satisfy himself by animal experiment that it was innocuous The other doctors in Lübeck are censured for their failure to exercise proper supervision over the administration of the vaccine or to report the outbreak when its significance was realized An article discussing Professor Lange's findings has been contributed by Professor Alberto Ascoli, director of the Tuberculous Vaccine Institute, Mailand, to the *Deutsche medizinische Wochenschrift* of July 11th (p 1160)

MEDICAL PARIS A CENTURY AGO

IN his interesting story of medical Paris a hundred years ago[1] Dr Marcel Fosseyeux, secretary of the French Society of Medical History, gives many personal details about the best-known contemporary medical men, who numbered some 870 for a population round about 700,000 with 20,000 births and deaths annually The reader is conducted through Paris, shown where the medical notabilities lived, and told something about their lives and characteristics Thus Broussais lived at 71, Rue Saint-Jacques, and waged war in the medical press of the day on the opponents of his physiological doctrine, he bled and depleted his patients freely, and in 1824 had himself bled to 20 oz on six occasions, and 50 to 60 leeches applied fifteen times within eighteen days for a digestive disorder His influence must have been powerful, for between 1824 and 1827 the number of leeches imported into France increased from 300,000 to the extraordinary figure of 33 millions Dupuytren, who lived at 4, Place du Louvre on the other side of the Seine, was the dominant surgeon of his time, and met with a haughty silence Richerand's *Histoire des progrès récents de la chirurgie*, which was directed against him There is also an attractive account of the Parisian medical societies and journals of the period, one of the latter founded by Bichat in 1798 had the intriguing title of "La Societe medicale d'emulation," and by 1830 had published twenty-nine volumes of *memoires* and *bulletins*

THE OSLER CLUB

THE Osler Club celebrated, on July 12th, at its headquarters in London, the eighty-first anniversary of the birthday of Sir William Osler Professor Harvey Cushing, having been welcomed as a friend of the club and as orator, gave an informal address, full of the charm and the whimsicality of his subject He told of the early Weston days, of Father Johnson and of James Bovell, and of how under their influence Osler turned from the Church to Medicine Professor Cushing, in his address, revealed some of the secrets of the writing of "The Life," and much else besides, to the delight of his audience Dr Arnold Klebs took up the tale, to be followed by Sir Arthur Keith Between the three, with occasional help from Sir D'Arcy Power, Dr Henry S Wellcome, and Mr Philip Franklin, a lively discussion continued, until Mr W R Bett, foreign secretary of the club, remembered that it was long past Osler's bedtime, and with a graceful tribute to the orator and to the influence of "The Life" upon the growing generations of medical men, brought the meeting to a happy conclusion Before the oration the club entertained Professor Harvey Cushing to dinner at the Langham Hotel

THE HALF YEARLY INDEXES

THE usual half-yearly indexes to the *Journal* and to the *Supplement* and *Epitome* have been printed, they will, however, not be issued with all copies of the *Journal*, but only to those readers who ask for them Any member or subscriber who desires to have one or all of the indexes can obtain what he wants post free, by sending a postcard notifying his desire to the Financial Secretary and Business Manager, British Medical Association House, Tavistock Square, W C 1 Those wishing to receive the indexes regularly as published should intimate this desire

---

THE Secretary of State for Scotland has appointed Mr A Froude, I S O , to be Registrar General for Scotland, in succession to Dr James Craufurd Dunlop, whose retirement under the age limit will take effect on September 3rd

---

A CONFERENCE of representatives of local authorities, convened by the Board of Control, was held on July 22nd and 23rd to discuss action to be taken under the Mental Treatment Act, 1930, which has just received the Royal Assent The subjects of discussion included provision of out-patient clinics, treatment of voluntary patients, and treatment of temporary patients under the new Act On the afternoon of Wednesday, July 23rd, the Minister of Health addressed the Conference

---

THE ANNUAL REPRESENTATIVE MEETING.

Friday, July 18th

THE Representative Body, for the first time in its history, met this year in the House of the Association, and seemed to appreciate the comfort of its surroundings Our full report of the proceedings on Friday and Saturday will be found in the *Supplement* The session opened with an expression of sincere regret for the absence of the Deputy Chairman, Dr Arnold Lyndon, whose health did not allow him to seek re-election to that office, and for the illness of Dr John Stevens In moving the election of the President for 1931-32 Dr Brackenbury drew attention to the fact that Dr W G Willoughby will be the first medical officer of health to hold that office, and that he will do so at a particularly appropriate point in professional development The election of Sir Ewen Maclean and Dr A D Blackader of the Canadian Medical Association as Vice-Presidents of the Association was carried with acclamation, and the representatives, after a tribute to the memory of Sir Jenner Verrall and Mr W E Hempson, settled down to the main business of the day Discussion on the report of the activities of the Association Professionnelle Internationale des Médecins served to illustrate anew the vitality and breadth of interest of the Warrington Division, and showed very general concurrence by the Representative Body in the Medical Secretary's opinion of the efficacy of legal sanctions for the suppression of unqualified practice The financial statement, made with the Treasurer's customary skill, elicited a pertinent contribution from a new member, Mr Pearce Gould Manchester's motion on the control of expenditure presumably owed its acceptance to the vigour and conviction of Dr D'Ewart's presentation of what he himself described as "a reasonably pious resolution designed to strengthen the position of the Representative Body," in the realm of finance Discussion on the Organization Report was chiefly noteworthy for the care with which the details of a scheme for according formal recognition of special service rendered by members were debated, commended, and amended up to the point of final adoption, when, suddenly realizing the implications of this attempt to give outward form to a generous sentiment, the representatives turned with relief to the way of escape offered by passing to the next business For the rest, the meeting refused to accept the Holland Division's appeal for a simpler definition of a decision of the Association," and resolved to shoulder its own responsibilities ignoring the dangerous allures of the referendum This decision it forthwith put into practice in what was, as the Chairman of the Insurance Acts Committee pointed out, a matter of fundamental importance The declaration that medical benefit under the Insurance Acts should be extended to dependants of insured persons was strengthened rather than weakened by the addition of a clause safeguarding the economic conditions essential to the provision of a sound service, which differed but little from an amendment framed by Warrington The balance of voting seemed to justify the attitude of confidence in the future, based on sane appreciation of existing conditions which distinguished Dr Dain's opening speech The Science Report gave representatives an opportunity to express their appreciation of the services rendered by individual members in connexion with the Association's work for the advancement of medical science, and of the high quantities of the work submitted by candidates for grants and prizes The discussion on the *Journal* showed a healthy desire for improvement, coupled with appreciation of the manner in which the difficulties of a transition period have been met Friday's session ended with the introduction by Dr Langdon-Down of a report on the ethics of remuneration and reward for research and invention, and a criticism of that report by Dr Graham Little

Saturday, July 19th

On Saturday the Representative Body turned to consider the two chief items of its agenda—the revised Hospital Policy and the Proposals for a General Medical Service The discussion on the former hardly lends itself to summary comment The basic principles at issue had, as pointed out by Sir Richard Luce in introducing the report, already been settled What remained for discussion was the suggestions made for their application in the complex and rapidly shifting field of hospital practice The problem before the Hospitals Committee had been to be of practical use without at any point hindering legitimate development or embarrassing those who are engaged throughout the country in the delicate task of readjustment to widely differing conditions On the whole, the debate, while it emphasized the bewildering variety of local and individual experience, resulted in endorsement of the methods formulated by the committee It certainly showed a lively appreciation of the importance of the points at issue Indeed, at one time it became necessary for the Chairman to read a proposed amendment not only to the main meeting in the body of the hall, but also to a minor meeting of contributors to the discussion gathered on the platform behind the chair The only point on which the recommendation of the Council was definitely rejected was the extension of the income limit for hospital contributory schemes This was negatived on the motion of Bristol and Liverpool under the apprehension that it would involve an encroachment upon the sphere of private consulting practice For the rest what may now as a result of the opening discussion on definitions safely be termed the "council hospital policy, was made more comprehensive by the addition of an alternative method of staffing substantially in the terms proposed by Brighton One appendix that concerning standards for hospitals of 100 and more beds was referred back as not dealing adequately with the needs of council hospitals under the new conditions The motion from Sunderland, designed to safeguard more effectively the free choice of medical attendance by private patients in all classes of institution, was referred to the Council, on the personal undertaking

of the Chairman of Council to consider the best method of providing for the desired result, and a few minor drafting improvements were adopted throughout the policy. Rejection of the amendments by Torquay and Wakefield designed to secure further discussion by the profession before adoption of the policy as a whole marked the appreciation by the Representative Body of the ample opportunities for discussion already offered at every stage of the development of the policy and the urgency of its immediate adoption as a working instrument. The debate was marked throughout by the agreement of every section as to the need for providing at all points for the access of the general practitioner to hospital practice, and a great measure of agreement upon the methods by which this might best be secured. Dr. Bone's introduction of the Proposals for a General Medical Service will repay study as a model of effective exposition, indicating without recapitulation of its contents the scope and aim of the report and the most profitable lines for discussion. His tribute to Dr. Fothergill as the instigator of the proposals and to Dr. Cox as responsible for the formulation of the committee's findings was the more impressive because, in the nature of things, such personal acknowledgements must be rare. At the outset the rejection of West Suffolk's suggestion that the proposals should be accepted merely as a defence against a whole-time State medical service cleared the way for their discussion as a constructive contribution to the service of the community.

Monday, July 21st

The greater part of Monday was spent in completing consideration of the Proposals for a General Medical Service, discussion turning for the most part on points of detail. As on Saturday, the amendments adopted in no way modified the general lines of the report. The addition, on the motion of Brighton and Chichester and Worthing, of provision for direct access of local medical advisory committees to local health authorities seemed not unacceptable to medical officers of health. The long debate on the inclusion of the estimates of cost in para. 72 of the proposals was directed merely to the advisability of quoting official estimates, not to the validity of any estimates put forward on behalf of the Association. The repudiation of a depressing picture of the rural practitioner sketched by Dr. Murray of Banff may have been due in part to the appearance of well-being presented by other rural practitioners who spoke on the motion as well as to their more cheerful estimate of prevailing conditions. A curious position arose from the absent-minded acceptance of an amendment by Kensington, in form a verbal adjustment of the summary of proposals, in essence a negation of the whole basis of earlier decisions of the meeting. The difficulty was solved by an adroit and timely suggestion on the part of Dr. Middleton Martin. Most of the debate on the motions by which it was sought to postpone the effective utilization of the proposals pending further reference to the profession might have been avoided if representatives had kept in mind the real nature of the proposals as explained at the outset by Dr. Bone, and not been misled by the frequent adoption by speakers of the shorter term "scheme," with its suggestion of a cut-and-dried plan of action. The amendments in question were rejected as soon as this point was effectively recalled. On the report of the Dominions Committee the Representative Body enjoyed, as usual, the opportunity of hearing the Oversea representatives. This occasion was marked by the appreciative account given by Sir Ewen Maclean of his recent tour and a description by Dr. A. Robertson of conditions in Victoria, which emphasized once again the similarity of professional problems in all parts of the world. The handling of the motion from Bombay was by no means an easy matter. Both sides displayed admirable restraint and discretion, and if comment were needed on this item it was supplied by Colonel Newcomb's description of the work of the Association in India as one of promoting good will and mutual understanding in very difficult times. Discussion of the Medico-Political Report was almost wholly confined to the determination of the fees to be asked for medical practitioners called in on the advice of midwives. The issue lay between the conviction of the Council as to the maximum fee likely to be obtained and the desire of representatives for payment commensurate with the service actually rendered. Dr. Langdon-Down and Dr. Parry's amendment to the Council's recommendation about the advice to be given on birth control at maternity and child welfare clinics was generally accepted by the meeting and by the Chairman of the Medico-Political Committee as an improvement on the original wording, and brought to a satisfactory end the discussion of a topic beset with difficulties. Discussion of the report on medical benevolence had unfortunately to start from much the same point as it has done since the Association first definitely assumed responsibility for taking a hand in this matter. It was relieved by the highly creditable record of activities undertaken by Portsmouth, and marked by an appeal from Dr. Walker, which at least deserves a more effective response from the Association as a whole than has yet been forthcoming.

All present at the Representative Meeting were greatly concerned to hear that Dr. J. R. Drever, the Scottish Medical Secretary, who was on the platform throughout the opening day, had been taken seriously ill on Saturday, and is now in University College Hospital. The representatives, before separating on Tuesday afternoon, authorized the Chairman to send a message of sympathy and good wishes to Dr. Drever.

The Oversea Luncheon.

On Friday, July 18th, representatives of the Oversea Branches and Divisions visiting London for the Annual Representative Meeting were entertained to lunch at the British Medical Association's House, Tavistock Square, by the officers of the Association, the Chairman of the Organization Committee, and the Chairman of the Dominions, India, Colonies, and Dependencies Committee. The other guests included Mr. Oswald Hempson and the senior officials of the Association. The chair was taken by Dr. C. O. Hawthorne, who, in a short speech, said that this "mid-day relief between sessions" enabled those with common interests and loyalties to make each other's acquaintance. This was the first time that those at headquarters had been able to entertain oversea guests in the Association's home. He wished not only to extend a very cordial welcome to the guests, but to express appreciation of their work and to acknowledge the generous hospitality always offered to official visitors from headquarters on their tours abroad. The Association at home was always very ready to receive suggestions from oversea delegates and to hear their experiences. It was a great source of satisfaction that the obstacles standing in the way of a post-graduate centre in London had now been removed, and that in the plans for the organization of the hospital and school the Association was taking its part. Dr. Hawthorne coupled with the toast of "The Guests" the names of Dr. Napier and Colonel Newcomb, who each expressed thanks for the warmth of their reception by the parent body and its officials. Dr. Hughes and Dr. Robertson also spoke. The names and constituencies of the oversea guests present are: Dr. F. Napier, Southern Transvaal; Lieut.-Colonel Clive Newcomb, South India and Madras; Dr. D'Arcy Moir, New Zealand; Dr. H. Wiltshire, Nyasaland; Dr. Hedley J. Brown, Queensland; Dr. A. F. Hughes, Grenada; Dr. Allen Robertson, Victoria; Dr. G. S. Woodman, Mesopotamia.

CONFERENCE OF THE BRITISH SOCIAL HYGIENE COUNCIL

THE question how to co-ordinate mat rnity and child welfare services with the efforts now being made to combat the spread of venereal disease was one of the topics discussed by the British Social Hygiene Council at an imperial conference held on July 14th at Westminster

The Right Hon L S AMERY M P who was in the chair, said that this question was of great importance for in the ante natal treatment of expectant mothers lay the hope of improving the health of future generations Experience showed that the percentage of healthy children born might be enormously increased by ante natal treatment The real remedy for venereal disease was not licensed hou es and periodical examination but the effective provision of treatment In the Dominions the willing support of the native women could best be secured through the agency of Europeans and the Colonial Office might well encourage the wives of colonial civil servants and officials to get into really human touch with the native population by learning the native languages.

DR FLORA LLOYD assistant medical officer of health for Swansea mentioned that the women s venereal disease centre in Swansea had been established in the same premises as the ante-natal and post natal clinics in order to avoid suspicion in the minds of women that they were being treated for venereal infection, there were however, differen rooms and different entrances. If patients asked a direct question about the treatment they were informed about their condition Only part time nurses were employed, and they were engaged al o in school and health v siting work The chief source from which patients reached the centre was from the ante natal clinic The child population was under close medical scrutiny and all suspicious cases were referred to the clinic for investigation A feature of the work of the Swansea clinic was the effective following up of cases The total number of attendances for 1929 was 10 548 A marked improvement had taken place in the general health and in the local conditions It was not thought in Swansea that the problem of discovering and treating venereal disease in mothers and children had been fully solved. The net was of very coarse mesh and probably caught only a small proportion of cases. Co-ordination with the maternity and child welfare and school medical services was fairly complete, but there was no linking with the venereal diseases department of the Swansea Hospital, and with general practitioners and the midwives The confidential nature of the treatment was a great tumbling block If the clinics became an integral part of the public health clinic services she believed that the work of detecting disease would become much more complete

DR SOCRATES NORONHA of Bombay announced that there a definite solution of the difficulty had been reached There was an infant welfare scheme in Bombay with ten centres each with special women officials, and including one or two venereal disease specialists, who worked at two special sessions per week All the suspected cases of venereal disease were referred to these special sessions.

MR E B TURNER said that those who had anything to do with the appointment of workers at these centres should bear in mind that the practitioners chosen should have a very definite knowledge of venereal disease Many newly qualified men were appointed to the centres whose knowledge in that respect was very slight When he was a member of the General Medical Council some years ago he had tried to arrange for venereal disease to be made part of the educational curriculum He looked through all the examination papers of every qualifying body and, of the huge number of questions, only three dealt with venereal disease.

Emigration and the Dominions

Several delegates addressed the conference on the subject of the treatment and prevention of venereal disease among migrants to the Dominions

DR MCCALLUM, chief medical officer of Australia House said that the population of Australia was increasing by 2 per cent every year, mainly in the transference of British folk and relatively small quotas from Continental countries. The Immigration Act definitely barred any person suffering from a serious transmissible disease Before assistance was granted to migrants each of them had to pass a special interviewing officer, and each report was examined at Australia House Medical references were checked over before approval was given Ships officers made it difficult if a case of venereal disease occurred on board for the infected person to escape a visit to the doctor who was in duty bound to report the case On arrival a Australia every passenger had to pass a doctor of the Commonwealth Department of Health Only the best human material could adjust itself to the new environment

MISS PUBY RICH late of the Racial Hygiene Association of New South Wales, urged the provision of suitable literature and the exhibition of films on emigration boat to impress on the emigrant the need for a high moral standard Film shown to adults should not be the same as those shown to younger people, they could deal with the biological statistical and practical human aspects of venereal disease The very worst time she thought to commence sex education was puberty, when the emotions were at high pitch

DR MYERS of New Zealand remarked that that country desired to have a type of settler who would be mentally physically and morally fit and a patriotic and worthy citizen of the new country They needed people of the highest possible qualifications He believed that films and books could do great harm if not properly suited to the people who were to see them

Biological Training in Schools

PROFESSOR JULIAN HUXLEY who delivered an address on biology in education said that this subject was of paramount importance for residents in agricultural countries especially if conditions were rendered more difficult by climatic causes or insect infestation He commented on the increase in mental defectives during the last twenty years Cinematograph films might be employed more extensively and there should be a certain amount of nature study in the educational programme of every child in the British Empire An exhibition was subsequently given of films

CONFERENCE DINNER.

In connexion with the Conference of the British Social Hygiene Council a dinner was held at the Cafe Royal on July 15th with SIR BASIL BLACKETT the president of the Council presiding the guests included a number of colonial administrators and officials of the Colonial Office

Proposing the toast of Health and Empire MR AMERY said that the conception of health having anything to do with Government was an almost startling novelty in this country only fifty years ago but it was now being accepted in every outpost of the Empire He reminded the gathering how enormous in extent and population was the tropical empire of Britain, nowhere in the world did problems of health have the urgency which they had in the Tropics. In the tropical world, due to causes only in small part inherent to the Tropics, and much more to neglect in the past and in the present, there were insidious enemies lying in wait to destroy both body and mind Mr Amery went on to refer to the possibilities of the Colonial Development Fund, which he had had a share in inaugurating in the way of assisting medical men practising in the colonies to take advantage of opportunities for post graduate study and also of sending out experienced specialists to confer with local administrators on health problems The British Social Hygiene Council which was most willing to co-operate with any Colonial Government was specially concerned to combat a group of diseases (venereal) which were preventable—that indeed was the starting point of its work—in a sense in which the customary diseases of the Tropics were not The toast was responded to by SIR RONALD STORRS Governor of Cyprus who referred in grateful terms to the results of a commission from the British Social Hygiene Council which visited Cyprus in 1926 on its way further east and left its mark he added on the modest health budget of the colony A local hygiene council had since been founded and there were five venereal disease clinics

MRS NEVILLE ROLFE secretary general to the Council proposed the health of The Guests and stressed the service which the wives of colonial administrators might do in the instruction of women in the countries to which they went Brief replies were made by the Right Hon SRINIVASA SASTRI and Lady BADDELEY wife of the Chief Secretary to the Government of Nigeria. In response to the toast of his health which was proposed by DR DRUMMOND SHIELS, M P SIR BASIL BLACKETT said that it had been a great pleasure to the Council

to entertain so many representatives from overseas He was afraid that in the course of the last generation some of the British self confidence in the mission of Britain to the world at large had evaporated Nevertheless, he thought it would be a misfortune if the idea weakened that there were British traditions and British ways of living which were well worth bringing to other peoples, among the ideas which Britain could impart none was more important than the teaching of modern science with regard to preventable disease

England and Wales.

New Public Health (Tuberculosis) Regulations

THE Minister of Health has issued further regulations[1] with regard to tuberculosis, amending those of 1912, 1921, and 1924, they will come into operation on January 1st 1931, and have been modified to correspond with changes involved by the Local Government Act of 1929 They provide that henceforth notifications by school medical inspectors shall be made upon the form prescribed for other primary notifications The wording of Article 5 of the regulations of 1912 has been amended in order to make it clear that previous notification in another sanitary district of the same county does not relieve the medical practitioner from his own duty in this respect unless he has reasonable grounds to believe that the case has already been notified to the medical officer of health of his own sanitary district With regard to the weekly notifications by medical officers of Poor Law institutions and sanatoriums a change has been made in the form to make it clear that the responsibility for the original diagnosis in such cases does not rest upon the medical officer of the institution The requirement that a notification transmitted to a medical officer of health shall be enclosed in a sealed envelope is considered to have been complied with if it is folded and sealed in such a way that, during its transmission, the particulars of the notification cannot be observed A paragraph has been added to make it clear that notification under these regulations is not required in cases where such notification is covered by Section 5 (*b*) of the Local Government Act (Emergency Provisions) Act, 1916 It is added that the notification register to be kept by the medical officer of health need not take the form of a book, the information may preferably be kept in a card system, and should constitute as far as practicable a record of those suffering from the disease The Minister emphasizes the point that, while the responsibility for the conduct of schemes for the institutional treatment of tuberculosis rests with the councils of counties and county boroughs, it does not affect the local functions of district councils as regards the prevention of infection These duties and powers of sanitary authorities in connexion with tuberculosis are defined in two articles of the new regulations, and the necessity of them being exercized is urged It is mentioned that the available information does not suggest that any serious proportion of the unnotified cases of tuberculosis can be ascribed to deliberate neglect on the part of medical practitioners by whom the disease has been diagnosed The two chief causes of delayed notification appear to be that the disease is not recognized by the practitioner in attendance, and that the tuberculous person does not consult a practitioner until his condition is already far advanced From this it results that in some areas a considerable proportion of cases are not notified before death, and that a still larger proportion are only notified during the last six months of life Medical officers of health are asked to use any opportunity which arises to remind general practitioners of the special facilities for diagnosis which are provided by the dispensaries of the county or the county borough council Further development of the educational side of anti-tuberculosis work should also be pressed, the Minister believes that there has been insufficient organized effort in some areas to issue simple statements about tuberculosis and the public facilities for its diagnosis and treatment The Ministry of Health has issued a circular (No 1107) to county councils and local sanitary authorities commenting on the implications of these regulations

[1] Statutory Rules and Orders 1930 No 572. H M Stationery Office Price 3d

Radium Treatment of Menorrhagia

Interesting conclusions about the value of radium treatment in cases of menorrhagia, based on experience gained at University College Hospital during the period 1921 to 1926 inclusive, appear in the Harker Smith Registrar's Report for 1929 In this condition the aim of radium treatment is to relieve the symptom rather than to cure the underlying disease, and in the record of cases included in the report the criterion of cure is the production of amenorrhoea or of periods not accompanied by excessive loss of blood In a few cases the patient denies having received any benefit from the treatment, in spite of the fact that this criterion of cure has been fulfilled, but such an attitude is usually due to severe menopausal symptoms In trying to gauge the severity and duration of menopausal symptoms after radium treatment the hospital authorities aim at keeping in touch with each patient for a minimum period of five years, the three-year period adopted in the past having proved insufficient especially in following up younger patients Some patients have started menstruating after periods of amenorrhoea varying up to four years As far as is known, only two of the patients have become pregnant after radium treatment, one gave birth at full term to a male child with double inguinal hernia the other miscarried These experiences and evidence derived from animal experiment suggest that the children of parents thus irradiated will be physically and mentally abnormal, and there are serious grounds for the view that young patients should not be treated by irradiation unless they are given doses large enough to produce sterility An analysis of the results of treatment in patients with menorrhagia due to no discoverable organic lesion brings out the following facts about dosage in no patient over 45 has a dose of 1,800 milligram hours failed to produce amenorrhoea, a dose of 1,500 milligram hours failed in the case of one patient over 45, but many cases have been cured with this and smaller doses, even as low as 600 milligram hours, in no patient in the age group 41 to 45 has a dose of 1,800 milligram hours failed, though 1,500 milligram hours was ineffective in two patients of this group, in one patient aged 40 a dose of 1,800 milligram hours failed to produce cure It appears, therefore, that the doses required to produce amenorrhoea in the age groups from 41 onwards are as follows 41 to 45, 1,800 to 2,000 milligram hours, over 45, 1,500 to 1,800 milligram hours In younger patients too few cases have been treated to warrant definite conclusions but it appears that the necessary dose in the age period 36 to 40 is 2,000 milligram hours or over, and in younger patients it is higher still All these doses are of course inadequate in cases due to organic disease, thus, two cases associated with fibroids in patients aged 46 and 57 respectively were not cured with a dose of 2,250 milligram hours each, and in cases treated with doses of under 2,000 milligram hours there occurred a larger proportion of failures than in the group of essential menorrhagia

Metropolitan Refuse Dumps

Miss Susan Lawrence, Parliamentary Secretary to the Ministry of Health, received, on July 17th, a deputation representing the Essex riverside local authorities affected by the dumping of refuse from the Greater London area Mr H T Muggeridge, M P, introducing the deputation, stressed the great danger to the health of rapidly growing communities from the present practice of forming huge, unsightly, and insanitary dumps in the areas bordering on London An interparty committee of members of Parliament had been formed to press for immediate action This committee had passed a resolution welcoming the recommendation of the Departmental Committee on London Cleansing that there should be a central responsible body

It was regrettable that that committee contemplated the continuance of the present method of dumping, for some more scientific methods of disposal should be possible If however, dumping in some form must continue, then the local authorities ought to have the right to veto the sites proposed subject to appeal to the Minister Mr F J Cole chairman of Hornchurch Urban District Council, and secretary of the Essex Riverside Advisory Committee said that the dumps fostered the breeding of rats and flies, they were a grave menace to the public health, as well as a danger to traffic by reason of the smoke and fumes which they give off The local authority had little or no control over them His committee wished to press for legislation prohibiting further dumping, except with the permission and under the control of the local authorities in the districts affected any cost incurred by this supervision to be borne by the dumping authority or its contractors The position had been acute since about 1922 when rapid development of the area began The local authorities did not wish to rule out dumping altogether, but they wanted to have their powers increased and something to be done soon

Miss Lawrence made no attempt to minimize the gravity of the present state of affairs She had examined one of these dumps and thought their existence was a public scandal The local authorities had, however not made full use of their existing powers There were two methods of procedure under the nuisance provisions of the Public Health Act and under the power to make by laws and obtain continuing penalties for infringement Hitherto, so far as she was aware, no Essex authority had made by laws on this subject Some other areas had done so, and enforcement of the by laws had resulted in improvement of the conditions Legislation was not only a question of the merits of the case there was the very great difficulty that the committee had not been able to agree on the constitution of the central authority and had made no recommendation on this most vital matter This meant, unfortunately, that any legislation was likely to be controversial, and the difficulty of finding Parliamentary time would be greater if no preliminary agreement could be reached She could make no definite promise of legislation next session The present position was that the standing joint committee of the metropolitan borough councils was considering the report, which had not been long in its hands, and the authorities concerned might profitably explore the matter with that committee Meanwhile the Minister proposed to take up with the borough councils the recommendation of the committee that the dumping authorities should be pressed to secure at once the discontinuance of the use of insanitary dumps for their refuse, and to take measures to minimize the unsatisfactory conditions now existing Mr Oldfield said that procedure on the lines of dealing with a nuisance was useless because it presupposed a dump procedure under by-laws was far more promising It would be more effective if higher penalties were provided and if the courts had also power, if they thought fit, to prohibit the recurrence of the nuisance There were sites altogether unfitted for any dumping at all The authorities wanted a veto subject to the decision of the Minister He thanked Miss Lawrence on behalf of the deputation for her very sympathetic reception

Actinotherapy at a Children's Hospital

The equipment in the light department of the Belgrave Hospital for Children, Clapham Road, S W consists of one mercury vapour lamp and one single-pole carbon arc lamp the former is used mainly for treating infants and younger children, the latter for treating older children unless more concentrated local irradiation is required In the report of the hospital for the year 1929 it is remarked that in a series of 77 new cases treated by ultra-violet radiation not one showed any ill effect from the treatment In 14 cases treatment was not persisted in but 55 of the remaining 63 derived appreciable benefit from it The conditions for which treatment was prescribed were various, and included among others, rickets, debility (a category in which were grouped children who were not doing well or gaining weight but showed no signs of organic disease), tuberculous cervical glands, abscesses ulcers, wounds and lupus vulgaris The total number of exposures given during the year was 1,919, 1,287 by the mercury vapour lamp and 632 by the carbon arc lamp All the rickets cases received ordinary dietetic treatment with cod liver oil, but the light baths were a means of shortening the time of healing especially in the more severe cases of active rickets The treatment was found to be very successful in promoting healing of sinuses wounds and ulcers good results having been obtained in every case Some of the debilitated children appeared to be unaffected by the treatment it is possible that the difference between their response and that of other debilitated children who derived benefit from the treatment may have been due to a difference in home conditions for these if bad enough would neutralize the effects produced by the light baths On the whole, the results obtained in the light department have been satisfactory, but another carbon lamp and a tungsten arc lamp are needed to make the equipment really efficient

London School of Hygiene and Tropical Medicine

On the occasion of this year's Colonial Office Conference an evening reception was held on Friday, July 18th at the London School of Hygiene and Tropical Medicine The guests were received in the magnificent library on the first floor by the chairman of the Board of Management Sir Harry Goschen, Bt, the chairman of the Court of Governors, Sir Holburt Waring, the Vice Chancellor of the University of London, Sir Gregory Foster, and the dean of the School Professor W W Jameson, in the regretted absence, through illness, of the director Sir Andrew Balfour H R H Prince George honoured the occasion by his presence, and after being received at the main entrance to the building His Royal Highness was conducted to the library and then visited the museum the laboratories and the lecture theatre During the evening a series of scientific exhibits was shown in the library by members of the staff, and technical demonstrations were on view in the various laboratories A cinema film entitled 'Better health," was displayed in the main theatre and a short lecture entitled "Insect and man some modern work" was given by Dr P A Buxton, director of the department of entomology The film depicted school life at the special schools of the Leyton Urban District Council

Winsley Sanatorium

The Winsley Sanatorium which is situated near Bath was opened in 1804 twenty-five years of work have now been completed during which period 8,649 patients have been treated In the annual report for the year 1929 it is mentioned that 378 patients were received, the average duration of stay at the institution being 102·4 days In 160 of these 378 patients tubercle bacilli were found in the sputum, comparing with 157 out of a total of 390 in 1928 Dr J D Macfie, the senior resident medical officer remarks that the statistical figures relating to admission and discharge have varied but slightly during the last ten years, and that it is obvious that the search for really early cases is as difficult now as it was when regulated sanatorium treatment was first introduced in Great Britain He regrets that inadequate attention is still being paid to the dental condition of patients requiring sanatorium treatment Sanocrysin alone as well as in conjunction with artificial pneumothorax has again proved to be a failure in spite of the great care taken with the size and spacing of the doses Dr Macfie quotes extracts from his paper on artificial pneumothorax (jointly with Dr G Napier) published in the *Journal* of March 8th which included an analysis of cases treated at Winsley Sanatorium from 1924 to 1929 He adds that the expression return to work' was used to include women who were able to perform household work, though characterized as not being on full work He is inclined to think that the more optimistic statement would have been quite justifiable, and more useful for statistical purposes

Scotland.

American Surgeons in Edinburgh

A VISIT of American surgeons, who are at present touring through some of the medical schools of Great Britain and the Continent, was paid to Edinburgh on July 14th, 15th, and 16th. The party included representatives of various surgical schools from New York to San Francisco and included several Canadian surgeons. The arrangements for a demonstration of surgical work in the Edinburgh Medical School were under the supervision of Professor D. P. D. Wilkie. A series of operations was carried out by the surgical staff in the seven operating theatres of the Royal Infirmary in the forenoon of each day, and demonstrations were given in the afternoons in the department of surgery of the university. These demonstrations consisted of talks of twenty to thirty minutes by various members of the Edinburgh school upon subjects to which they had devoted special attention, such as thoracic surgery, the cause of torticollis, excretion pyelography, post-carotid ganglionectomy, precancerous changes in the breast, splenic anaemia, renal reabsorption, and the history of the Edinburgh Medical School. On Wednesday evening, July 16th, a dinner was held in the Hall of the Royal College of Physicians, at which the American guests were entertained by the surgical staff of the Edinburgh school. Emeritus Professor Sir Harold Stiles occupied the chair, and referred to the cordial relations which were growing more and more intimate between surgeons in Britain and those on the American continent. The toast of "The Guests" was acknowledged by Dr. William Darrach, dean of the Columbia University Medical School, New York, who spoke of the preference that existed among American surgeons for the study of British rather than Continental surgery.

Edinburgh Dental School

The summer meeting of the Edinburgh Dental Hospital was held on July 8th for the purpose of presenting prizes to the students who had been successful in the preceding academic year. Dr. William Guy, dean of the school, presided, and the prizes were presented by Dr. James Haig Ferguson, President of the Royal College of Surgeons of Edinburgh. Dr. Haig Ferguson remarked that the College of Surgeons realized that dental students constituted no small factor in the prosperity and excellence of the medical school. More than one thousand men had taken the L.D.S. diploma of the Royal College of Surgeons, and the College had therefore a special interest in this dental school. Preventive medicine was now everywhere in evidence in the medical world; this was seen particularly in the relation of the teeth to general diseases. The value of close co-operation between the dentist and his medical colleagues could not be overestimated. If an apple a day kept the doctor away, it was equally true that a raw apple at night kept the teeth clean and bright.

New South Wales.

[FROM OUR CORRESPONDENT IN SYDNEY.]

Professorial Appointments at Sydney University

UNDER the Bosch benefaction at Sydney University the following appointments have been made: chair of surgery, Harold Dew, B.S., F.R.C.S., chair of bacteriology, Hedley Duncan Wright, M.D., D.Sc.; chair of medicine, Charles George Lambie, M.C., M.D., F.R.C.P.Ed. Professor Dew graduated M.B., B.S. from Melbourne University in 1914. In April, 1915, after a year in Melbourne Hospital, he joined the R.A.M.C., in which he served till 1919, being awarded the Medaille d'Honneur in 1916. For a year after the war he remained in London attending post-graduate classes, at the end of which time he was admitted to the Fellowship of the Royal College of Surgeons. In 1924 he was awarded the Jacksonian prize of the College, and in 1927 he completed the work *Hydatic Disease*, which won a share of the Syme research prize of Melbourne University. For the last ten years he has been practising surgery in Melbourne, acting, in addition, in an honorary capacity at the Walter and Eliza Hall Institute of Research in Pathology and Medicine. Professor Wright graduated B.A. from the University of Tasmania, and in 1916 graduated M.B., Ch.B. from the University of Edinburgh. He then joined the R.A.M.C., with which he served till 1920. On his return to Scotland he was appointed lecturer in the department of bacteriology of the University of Edinburgh. In 1921 he became a Member of the Royal College of Physicians, Edinburgh, and soon after was awarded the Lister Research Fellowship of that college. In 1925 he proceeded M.D.(Ed.), winning a gold medal, and in 1927 obtained the D.Sc. In 1925 he was appointed assistant lecturer in bacteriology in University College Hospital, London, where he afterwards acted as lecturer. In 1928 he became reader in bacteriology in London University, taking charge of the teaching and research work. At the Annual Meeting of the British Medical Association in Edinburgh three years ago he was vice-president of the Section of Pathology; he is a member of the council of the Pathological Society of Great Britain, and assistant editor of the *Journal of Pathology and Bacteriology*. Professor Lambie graduated M.B., Ch.B. in the University of Edinburgh in 1914. At the opening of the war he joined the R.A.M.C., with which he served for five years, being awarded the Military Cross. He is a Fellow of the Royal College of Physicians, Edinburgh, and a Fellow of the Royal Society of Edinburgh. In 1927 he proceeded M.D. At the present time he holds the positions of assistant physician to the Royal Infirmary, Edinburgh, lecturer in clinical medicine in the University, and lecturer in medicine in the School of Medicine of the Royal Colleges at Edinburgh.

The Late Dr. H. W. Armit

With the death of Henry William Armit the medical press of Australia has lost a tried and valued servant, and the medical profession a true friend. From the date of his appointment to the editorial chair of the *Medical Journal of Australia* his main object in life was to ensure its success from the scientific, literary, and ethical standpoint. He was particularly well fitted for his position, he was a man of wide reading and knowledge, and, in addition to a long journalistic probation, he had had a special training in Association affairs, resulting from his service on committees of the British Medical Association, which rendered his editorial pronouncements valuable whether in medical, medico-political or medico-ethical subjects. A man of strong personality, with high aims and ideals, he held strong views, if at times intolerant of opposition, he was always single-minded and fearless in his advocacy of any cause he felt to be right. His loss will be greatly felt.

India.

Jubilee of the "Indian Medical Record"

THE *Indian Medical Record* was established in 1880 by the late Dr. J. R. Wallace, who became secretary of the Indian Medical Association when this came into existence later. The February number appears as a jubilee issue, and contains an account of the sometimes chequered history of this periodical during the last fifty years. One characteristic feature of its past has been the active interest it has always taken in campaigns against certain widespread diseases; thus, special issues devoted to tuberculosis appeared in 1913 and 1925, the first being characterized by the attention devoted to methods of prevention. Special numbers dealing with a kala-azar epidemic in Bengal were published in August and September, 1923, and another special issue was devoted to the inauguration of the anti-leprosy campaign in India. A series of editorials in 1921 dealt with suggested schemes for the improvement of medical education in India, and active steps were taken at one time to combat the sale of unauthorized medical diplomas hailing from American sources. The present issue contains a large number of special articles on therapeutic and diagnostic topics. Dr. E. Muir contributes notes on the recent advances in the treatment of leprosy, and Professor P. Ganguly discusses an investigation into the prevalence of tuberculosis in Bengal. Comments are

made on the progress of ante-natal and post-natal work in India by Lieut.-Colonel V. B. Green-Armytage, I.M.S., professor of obstetrics and gynaecology, and surgeon to the Eden Hospital, Calcutta. Dr. J. E. Napier of the Calcutta School of Tropical Medicine, gives a short account of what India has done towards solving the kala-azar problem. An interesting frontispiece depicts Dhanvantari—according to Hindoo mythology, the founder of medical science. Reference to a primaeval churning rod and to the assistance of Vasuki the king of the snakes recalls inevitably Aesculapian symbolism. Since 1921 Dr. S. K. Mukherji has edited the *Indian Medical Record*, he must certainly be congratulated on the general excellence and interest of this jubilee issue.

Welfare Work in the Central Provinces and Berar

Under the auspices of the Central Provinces and Berar Red Cross Association welfare activities are extending in the main towns and villages. The work of the Association is conducted in an area of over 100,000 square miles and there are now forty-three welfare centres in good working order, while seven new ones will shortly become affiliated. There is also an efficient school for training health workers, a nursery school is being successfully carried on, and there are good facilities for the training of native midwives. The association has been in existence for six years and is now extending from the towns into the more rural areas, thirty village centres having been brought into being. During 1929 a vigorous scheme for training native midwives was started in the province, but it appears from the annual report for that year of the work of the Central Provinces and Berar Red Cross Association that the effort largely failed, it being found impossible to raise enthusiasm locally. Doubt is expressed whether the present method of training these women by weekly classes, arranging for a certain amount of supervision, and awarding stipends and prizes, is altogether satisfactory, a conference is to be held to discuss the problems which have been disclosed. Great difficulty also is being experienced in finding suitable candidates for health training, the midwives who might be worth consideration in this respect are, however, generally of low educational attainments and of inferior social standing.

South Travancore Medical Mission.

The South Travancore Medical Mission at Nevvoor was founded in 1838, and is conducted by the London Missionary Society. The annual report for 1929 indicates the extent of the work and the popularity that has been won. During 1929, 1,075 major and 907 minor operations were performed in the hospital, while over 13,000 operations were performed in the associated out-stations. Dr. I. M. Orr, one of the two European medical missionaries in charge, contributes to the annual report for that year some surgical notes, from which it appears that the large number of cases of chronic appendicitis treated by operation is attributable to the delay before patients can reach the hospital, and possibly to the prevalence in Travancore of unsuitable diet and chronic constipation. He believes there is a definite relation between diseases of the appendix and affections of the stomach and duodenum. Puerperal sepsis is very common in this part of India, and Dr. Orr reports that very good results have followed the treatment of the uterus with glycerin combined with daily intramuscular injections of streptococcal immunogen. An isolation ward on modern lines was being erected when the report was prepared. A new branch hospital was opened in October at Kalavapuram, and, being situated on the main central road, is receiving patients from a very wide area. Branch hospitals in connexion with the central institution now extend for 100 miles through Travancore, reaching almost to Cape Comorin. With one exception, however (Nedungolam), they have no operating theatre accommodation and therefore many patients requiring major operations have to travel long distances to Nevvoor. These branches are supervised by members of the staff at the main hospital who pay occasional visits, despite their limitations they are rapidly growing in importance as treatment centres. The Nevvoor leper asylum is able to accommodate some seventy patients.

Correspondence.

STERILIZATION OF THE UNFIT

SIR,—We have read with interest the editorial article in the *British Medical Journal* of July 5th upon the above topic. We have also read in the issue of July 12th your appreciative summary of the memorandum of the Eugenics Society.[1] May we draw attention to an argument advanced in your article which we regard as important. This is that, whereas sterilization may be an appropriate measure in individual cases for personal and family reason it is useless and futile as a eugenic measure calculated to diminish the incidence of mental defectiveness. There are two considerations bearing upon the general subject of sterilization and upon your particular view of its usefulness as set forth in your article which we think deserve attention.

1. Discussions on the sterilization of the unfit usually follow somewhat stereotyped lines. It is not necessary here to outline the arguments habitually used by advocates of sterilization. By opponents of this measure however two assumptions are very frequently made about the attitude of their adversaries which lead to much confusion. In the first place, it is assumed that advocates of sterilization propound this measure as an alternative to segregation, which will effect drastic economies for the ratepayer, and render most or all institutional accommodation for defectives superfluous. Secondly, the sterilizationist is credited with supposing that the national stock can *rapidly* be purged of its *entire* burden of defectiveness by the application of the *panacea* of *wholesale* sterilization to certifiable defectives. (The four italicized words occur with predictable regularity in these representations.) After attributing to him these extravagant beliefs, the "segregationist" has little difficulty in disposing of his opponent's arguments.

2. Opponents of sterilization invariably, within our knowledge, give prominence to the argument that because the *bulk of defectiveness is carried* "by normal or subnormal but not defective persons, any measure of sterilizing certifiable mental defectives which ignores non-certifiable carriers of defectiveness is useless and futile. Since you state in your article that "public opinion, even intelligent public opinion, is misdirected in this matter—even by certain persons and societies who might be expected to know better" and since the main argument of your article is to the effect that sterilization is useless as a eugenic measure for the benefit of the race we should like to make it clear what exactly the Eugenics Society stands for in this matter.

The Eugenics Society has never held that sterilization was an *alternative* to segregation. Our late president, Major Leonard Darwin, was so explicit about the matter that it is surprising to find the views of the society over which he presided so widely and flagrantly misrepresented. He wrote: "Segregation should be regarded as the normal method of dealing with all aments, and segregation if properly conducted, does meet all the racial requirements."[2] He advocated voluntary sterilization, not as an *alternative* to segregation, but as a *complement* to it, and wrote: "As regards the immediate future what is most needed is the supply of further accommodation for aments." Neither has the Eugenics Society ever held that a policy of even "wholesale" sterilization would *completely* eradicate mental defectiveness from the national stock. The question of the carrier has been carefully considered by the society which holds that while the problem of defectiveness will always be with us it is open to us to determine whether in the future the problem will be restrained within negotiable limits or whether it will swell to wholly unmanageable proportions.

The Eugenics Society disagrees with you and with Dr. Gill whom you quote with approval as saying: "If every certifiable mental defective had been sterilized twenty or thirty years ago it would have made little appreciable

[1] Obtainable from the secretary, Eugenics Society, 20, Grosvenor Gardens, S.W.1, price 6*d*.

[2] Darwin, Leonard. [illegible] Reform. Murray, 1926, p. 20.

difference to the number of defectives existing to day" One of us has shown[1] that even on the most unfavourable genetic and social assumptions with regard to defectiveness, the incidence of mental defect would be reduced by as much as 17 per cent in one generation if all defectives in that generation were prevented from having children We would further point out that Dr Gill's conclusion is one of profound pessimism According to the report of the Joint Mental Deficiency Committee, the apparent incidence of mental defectives has nearly doubled in the last twenty years If the prevention of defectives from having children, by sterilization, is useless, so also must be the prevention of them having children by other measures, such as segregation and prohibition of marriage All measures, in fact, are useless on this assumption, and pending the detection and sterilization of the "carrier" we are confronted with the prospect of a continual acceleration of whatever increase has really been taking place

In conclusion, we would like to emphasize a feature of our memorandum to which you have drawn attention in your summary Our proposals have been carefully devised to harmonize with the recommendation of the Mental Deficiency Committee, and to assist rather than to impede the creation of simpler institutional accommodation for mental defectives —We are, etc,

COLOUR VISION TESTS

SIR,—In reference to the leading article on international colour vision tests in the *Journal* of July 12th (p 68), the first point is that the mass of misstatements on this subject should be corrected, and the tests be based on the facts of colour-blindness As stated by the Colour Vision Committee of the British Association, the old theoretical classifications should be discarded, since the facts do not agree with the definitions Defects of light perception are quite distinct from defects of colour discrimination The two essentials of a practical test for colour-blindness are that dangerously colour-blind persons only should be rejected by it, and that no dangerously colour-blind person should escape detection The wool test with five test colours allows 50 per cent of dangerously colour-blind to escape detection, and of those rejected by it 50 per cent are practically normal sighted Most of the other colour vision tests are as defective, if not worse The report discountenances the use of colour names, and recommends Stilling's test

The three most dangerous groups of colour-blind persons are the dichromic who see two colours in the spectrum, the trichromic who see three colours in it and have no yellow sensation, and those who have considerable shortening of the red end of the spectrum An examination of one of each of these groups will show definitely the value of colour names A dichromic regards a certain green as white and a corresponding purple also as white When shown these colours why should he call them anything except the white which he sees? If the green be made yellower he will immediately call it green, if made bluer he will call it blue The trichromic who sees yellow as red-green miscalls this colour red or green Those with shortening of the red end of the spectrum may be shown a red light which they do not see at all, and say so They may be shown a pink which appears to them a definite blue as indeed it does to a normal-sighted person when examined through a blue-green glass The colour-blind name colours in accordance with their colour perception

The pseudo isochromatic tests in common use are those of Stilling Ishihara, and my card test In order to ascertain the relative merits of these three tests thirty-eight consecutive referred or appeal cases were examined at the Board of Trade None of these was examined by me alone, at least three persons, and often more, were present at all the examinations In every case Captain Ellery or Captain Dowdy and the recorder were present Each candidate was first examined by the pseudo-isochromatic tests, and the fact whether he was dangerously colour-blind or not was ascertained subsequently Ten of the 38 cases were passed and 28 rejected, of the latter, 16 failed with all three pseudo isochromatic tests, but 12 of those rejected passed the Ishihara test completely, and 11 that of Stilling Of those who were passed, 7 showed defects with my card test, of those who failed, all were rejected by my card test, in most cases failing very badly, as, for instance, not reading card 8, a yellow-green C on an orange ground The explanation of the difference is that a test for a dichromic will not necessarily detect a trichromic who has three colour sensations—red, green, and violet—but no yellow sensation, he is obviously dangerous, as shown by the examination with the lantern and spectrum tests In my card test also the pattern is the same on every card, so that the examinee has to judge by colour alone and cannot follow the design of the artist

An important point to note is that a test which is difficult to the normal sighted is *not necessarily difficult* to the colour-blind This is shown by the number of colour-blind persons who can read Stilling's plates Nos 9 and 10, the reading of which is supposed to indicate very good colour perception In fact, a test may be constructed which can be read by the colour-blind but not by the normal sighted Nagel's anomaloscope is not a satisfactory test, since a man may be anomalous without being colour-blind, and 90 per cent of the colour-blind agree with the normal equation —I am, etc,

Board of Trade, S W, July 20th F W EDRIDGE-GREEN.

STORAGE OF X-RAY FILMS

SIR,—I have read a letter in your issue of July 5th from Mr E J H Roth Subsequent to the Cleveland disaster in America last year, the X-Ray and Radium Protection Committee carefully considered the whole question, several meetings were held under the chairmanship of Sir Humphry Rolleston, and, finally, definite recommendations were issued These recommendations were published in the *British Medical Journal*, in other medical papers, and in the *British Journal of Radiology* In addition to this, many hundreds of copies of these recommendations have been sent to hospitals throughout the country The Ministry of Health is not only very much alive to the possible dangers, but is making full use of the committee's recommendations Further, the London County Council and other public bodies are making inspections and advising that efficient film storage and the periodic and drastic weeding-out of used films should become the universal practice Special film stores are being provided in all new, and in many old, departments on the lines suggested by the committee

The question is one of some importance, though it is a matter of surprise to me that your correspondent should be in ignorance of all that has been done in the matter The manufacturer who can produce a satisfactory "safety" film—that is to say, a film with an *acetate* instead of a *nitrate* base—will do much to solve the problem At present the safety films on the market are not easy to handle, and they are inferior in quality May I suggest —as I fear that your correspondent does not, or has not, read his journals as all good doctors ought to do—that it might be a gracious act on your part once again to publish the recommendations of November last —I am, etc,

STANLEY MELVILLE,
Honorary (Medical) Secretary, X Ray and Radium Protection Committee.

London, W 1, July 16th

*** The committee's recommendations were printed in full in our issue of November 16th, 1929 (p 923) If there is a general wish for their republication we will act on Dr Melville's suggestion —ED *B M J*

INTRAVENOUS SCLEROSING SOLUTIONS

SIR,—The recent articles on alternative solutions for the injection treatment of varicose veins will doubtless be of interest to many who practise the injection treatment It is obvious from the variety of solutions recommended, and the different methods of employing them, that there is no solution which can be called highly satisfactory Like others, I have had very variable results with different solutions, sometimes getting a very extensive painful thrombus with a small dose, but more frequently getting absolutely no result whatever, even when I used large doses of the solution

I tried sodium morrhuate in 5 per cent solution in doses of 2 c cm into each puncture of a vein area, and obtained no result whatsoever in four different cases I should be very glad to learn from some of your readers whose experience is extensive how soon after an obvious failure with 20 per cent quinine and urethane or sodium salicylate or 5 per cent sodium morrhuate, can one proceed to inject the same veins again? I find patients are greatly disappointed when nothing whatever happens after for example, the injection of 1 c cm of quinine and urethane, since they have usually been recommended to come to me by others who have been treated by me, obtaining a good, firm thrombus in the vein, and ultimate success These patients usually want another injection two or three days after the first failure, and ask for a good strong dose I have only once tried this method, and again got no result Perhaps some other solution, or a combination of two solutions, would be effective —I am, etc ,

Charing Kent July 21st. H E LITTLEDALE

TECHNIQUE OF INJECTING VARICOSE VEINS

SIR,—I read with great interest Dr Noel Scott's article on the treatment of varicose veins by injection, in the *Journal* of July 12th (p 53), and found myself, with just one exception, in complete agreement with every point in his able description This exception occurs in the following passage "It is not desirable to use a tourniquet because it produces venous engorgement, it is difficult to manage single-handed, and it causes considerable pain to the patient" I should therefore like to put forward my own experience as to the value of the tourniquet in the technique of vein injection

Dr Scott states in his article that "the ideal position of the patient is prone upon a couch," yet he acknowledges that "in most cases the patient is treated while sitting on an ordinary chair" I take the view that the injection should *always* be given with the patient recumbent, and *never with the legs down*, and should like to quote the following extract from my book, *Varicose Veins, Haemorrhoids, and Varicocele their Treatment by Injection*, to explain my reasons for being so emphatic in this respect

> In the upright position, the vein being distended with blood during the actual injection of the sclerosing solution the degree of dilution cannot be gauged, and this tends to produce varying results Whereas in the lying position, the vessel is collapsed and practically free from blood, and, accordingly, the same dilution is not in effect Also, when the vein is distended, leakage of blood or solution around the site of puncture is more likely, resulting in sphacelus or haematoma production, or, at the least, considerable bruising With the subject in the lying position the operator is able to perform the treatment with much greater ease and can control the point of his needle with much more certainty, since he may steady his hands by resting them on the patient's leg, thus avoiding the danger of having the needle point slip out of the lumen of the vessel or pierce the deep wall of the vein One final advantage of the lying posture is that it is decidedly rare for the patient to feel in the slightest degree faint, whereas in an upright position faintness is not uncommon

If the above seems to show that the recumbent posture of the patient is essential, then it seems to me that any technique which makes this position possible providing it is devoid of any vital objections, is the one to employ Now the use of the tourniquet certainly does make the recumbent position possible in all cases and I am sure I can show that it is devoid of any vital objection

In the first place, Dr Scott's objection on the score that the tourniquet causes considerable pain to the patient may be declared null and void if the pneumatic tourniquet is employed, especially when it is used with a manometer The pressure need never exceed 140 mm Hg and provided that the tourniquet is a nice wide one, the sensations of the patient will certainly not register pain Secondly the statement that a tourniquet is difficult to manage single-handed certainly applies to most designs but it most decidedly does not apply to the pneumatic sort When using the latter, as soon as the needle is in the vein no dexterity at all is required to release the valve with one hand, while the other holds the syringe perfectly steady Finally, Dr Scott maintains that it is not desirable to use a tourniquet because it produces venous engorgement But, surely, this is just what is required in order to introduce the needle into the vein That it is completely undesirable after this has been effected, I agree but I never start to inject the sclerosing fluid until all tourniquet pressure has been released and the veins have flattened, leaving the leg pale in colour

In conclusion, I am sure that those who care to try this method of using the pneumatic tourniquet with manometer will soon be saying, "Since then I have used no other"—I am, etc ,

London W1, July 15th RONALD TREVENNEL, M B Ch B

TREATMENT OF ANAL FISSURE, SPASM AND PRURITUS ANI

SIR,—Dr Frank Howitt's article published on June 28th (p 1163) was of much interest, but its utility will be lessened if it should lead to the impression, as it well may, that stricture, ulcer, and painful spasm of the rectum frequently follow operations for haemorrhoids They only arise as the result of wrong or unskilful technique, and in these circumstances are unfortunately liable to occur no matter what type of surgical operation or injection (should the injection method be used) is employed

Dr Howitt discusses a paper by Bensaude and Meyer which gives results of the treatment by diathermy of 114 cases of stenosis and spasm of the rectum I am familiar with the work of these eminent writers, and have frequently visited Dr Bensaude's clinic for the non-operative treatment of gastro-intestinal and rectal complaints at the Hopital St Antoine Paris A large number of their cases of stricture and ulceration are not the result of operations for haemorrhoids, but are due to syphilis and gonorrhoea In this country such cases are probably to be found mainly at genito-urinary and venereal clinics, since, admittedly, stricture cases seen at our own rectal clinics are usually due to sloughing and necrosis following badly performed operations, or following injections (for piles) which have been given in too great strength or amount, or into a wrong site

Treatment by diathermy is effective in these cases Prevention is, however, better than cure Neither stricture nor ulceration nor other painful conditions will occur if the correct technique is employed for injection and ligature methods, and there is careful selection of cases suitable for the mode of treatment adopted In fourteen years' experience, and in several hundreds of cases, I have not had a serious ill-effect following either injection or ligature of haemorrhoids (under local anaesthesia)

Operative and injection methods have each their own extensive field of usefulness within which each is the method of choice My technique (a modification of that described by Mr Mummery and Mr Buck) and mode of selecting cases I described in the *Journal* of April 19th, 1924 Readers will also find in the *Practitioner* of March, 1915 a full discussion of the advantages and disadvantages of both injection and operation by eminent proctologists who first introduced the injection method

For the treatment of fissure there are simpler and more effective methods than diathermy Bensaude himself has discarded it, and now employs a modification of a method which I have used for many years He injects a few

drops of quinine-urea solution under the fissure and touches the surface with pure silver nitrate. He assured me his results were satisfactory in most cases. My own method (realizing that spasm of the sphincter is the cause of delay in healing) is to anaesthetize the sphincter with 0.5 per cent. novocain or quinine and urea solution, using the same technique which I employ for removal of haemorrhoids (*Journal*, March 16th, 1929), and injecting also a few drops beneath the fissure. The sphincter relaxes almost immediately and a speculum can be painlessly passed for the diagnosis or treatment of other rectal conditions. A simple dressing such as pure ichthyol should then be applied daily. (I claim no originality for this method, which has been practised by Hirschmann and others for many years.) Old and dense scar tissue when present I then remove by the simple method advised by Mummery. Many fissures of old standing can only be cured by this little operation.

The introduction by Mr. W. B. Gabriel (*Journal*, June 15th, 1929) of a new preparation, "A.B.A. anaesthesin solution," a most valuable contribution to the treatment of ano-rectal complaints, has made this method of treating fissure more effective since the anaesthetic effect lasts many days. I now employ A.B.A. in preference to novocain.

For pruritus ani, if a lengthy trial shows that the good effects of the A.B.A. solution are permanent—and Mr. Gabriel's experience, described with such restraint, holds out hope for this result in certain cases—the great value of this solution will be inestimable. Colonel W. P. MacArthur's letter in the *Journal* of June 28th (p. 1195), especially his helpful advice on diagnosis and treatment, was of much practical value. I also have found threadworms in many cases. Ball's operation, although recurrences after it are frequent, has given relief in many instances I have known when all other methods were useless, but it should not be advised, and seldom is, until other means have failed. The fact that patients sometimes submit to it a second time and demand it themselves (I have known more than one such patient) is evidence of how sufferers appreciate even its temporary efficacy. General as well as local examination is necessary, since intractable pruritus is often a symptom of remote disease, such as diabetes.—I am, etc.,

London, W.C.1, July 14th. P. KENNEDY MURPHY.

DERMATITIS FOLLOWING USE OF IODINE SOLUTION

SIR,—Mr. Charles Alexander's description in the *Journal* of July 19th (p. 100) of a case of fatal dermatitis following the use of iodine spirit solution prompts me to record two cases which, fortunately, did not end fatally, but caused much pain and distress, and were due to the use of the common tinct. iodi mitis, *B.P.*

The first was that of a man, aged 42, who used the tincture as a counter-irritant for a dull ache in his left arm and forearm. Three hours after a single application the arm was covered with huge blisters separated from each other by superficial cracks of the skin. When I saw the patient he was sitting in bed undressed swaying, and supporting with his right hand the painful arm. He had a pale, sunken face, and was obviously in great pain, his temperature was 100° F., and his pulse 60. Soon after I arrived he vomited, and complained of dimness and severe headache. I treated the patient as for burns and he was able to leave his bed on the fourth day, the arm healed without complications.

The second patient, a woman aged 40, had a small superficial cut (a few millimetres long) on the palmar aspect of the terminal phalanx of the fourth finger of the left hand. She used the remnants of tinct. iodi mitis which she had in her medicine chest, and soon after complained of severe pain in the hand and arm, so unbearable that I was called out at 2.30 a.m. Solutions of liquor ammon. sod. bicarb. and alcohol were used; the pain eased, and she was able to sleep a little. The finger was swollen, and slight pain, concentrated in the terminal joint, which was stiff, persisted for several days, when the skin broke and some fluid escaped.

While there is no doubt that the tincture used in the last case was an old evaporated, and therefore concentrated, solution, I am not sure what the tincture in the first case looked like, except that the patient bought it from well-known chemists in the district. Both patients are healthy individuals, and do not remember ever using tinct. iodi before.

It seems likely that these were cases of idiosyncrasy, but whether the character of the solutions used had anything to do with the pathological phenomena is impossible to say. It warrants, however, careful observation by everyone using iodine in some form or other.—I am, etc.,

London, N.4, July 21st. D. G. DE BOUK.

*** In the nineteenth edition of *The Extra Pharmacopoeia* (Martindale and Westcott) the warning is given that the tinctura iodi (mitis) "should be recently prepared, or is liable to contain aldehyde and hydriodic acid. This aldehyde in presence of iodine and water oxidizes, forming more hydriodic acid as well as acetic acid. The acetic acid may become etherized, forming ethyl acetate. A little iodic acid added to the tincture will prevent decomposition, it breaks up hydriodic acid as formed."

ANAPHYLAXIS AND DISEASE

SIR,—I am greatly interested in a remark by Dr. Langdon Brown in his paper on predestination in disease (*Journal*, March 22nd, p. 525). He writes: "In less degrees both allergy and anaphylaxis declare themselves in violent attempts to get rid of the foreign invader. These attempts take the form of diarrhoea and vomiting or of giant urticaria, or of asthma."

In an article on anaphylaxis printed in the *Medical Journal and Record* of February 3rd, 1926, I tried to place these phenomena under the parasympathetic mechanisms. Briefly, they may be expressed thus. All tissues under the control of the automatic system must be in communication with one another by means of either nervous or hormone influence. They must either have one set of impulses stimulating their function and another inhibiting it, or they must have stimulating impulses alone, the tissues resuming normal function on cessation of the stimulus. The automatic nervous system, together with certain of the ductless glands, is clearly divided into opposing forces each of which has its special functions.

With the sympathetic are bracketed the thyroid, pituitary, and gonads, and with the parasympathetic are associated the parathyroids, thymus, pancreas, spleen, liver, and possibly others. Dr. Langdon Brown has well described how the sympathetic system and its allies take control of all matters pertaining to defence and self-preservation against all factors potential for harm, be they bacteria, wild animals, or financial difficulties, when excessively stimulated they cause symptoms, as seen in exophthalmic goitre and shell shock. The parasympathetic and its auxiliaries preside over the assimilation of food when once procured, and the elimination of all wasteful and harmful products. This is clearly shown by the innervation of the intestine. Stimulation of either of these groups produces a characteristic train of symptoms varying largely according to the severity of the stimulus. The most primitive of the parasympathetic reactions is to eject or vomit. Almost any parasympathetic stimulus causes this, as is seen in sea-sickness from vagal irritation of the semicircular canals. The vomiting of pregnancy is possibly due to stretching of the uterus, thus, as well as early attempts at smoking, stimulates the vagus unduly. Increased intestinal peristalsis resulting in diarrhoea is due to increased vagal stimuli. Vagal stimulation causes contraction of the bronchial muscles, producing asthma. When toxic material gains entrance to tissues that are sensitized immediate efforts are made to eject it, this takes the form of urticaria or angio-neurotic oedema, and is identical with that produced by any dermal test for foreign protein. This reaction must also fall into place as a parasympathetic act, and is part and parcel of the same mechanism which enables an amoeba to extrude undigested material. A stimulus may produce the whole syndrome or part of it according to its severity.

The understanding of these two syndromes will help much to unravel symptoms generally, which will be found to fall

into three main groups those due to direct injury of tissues and organs impairing their function, those due to sympathetic overactivity, and those due to overactivity of the parasympathetic group The vitamins probably form another group of their own

It would be interesting to have expressions of opinion on these matters, since I believe the placing of anaphylactic phenomena under the parasympathetic group is a new conception —I am, etc,

SYDNEY PERN, M R C S, L R C P

Melbourne June 11th

SPONTANEOUS SURGICAL EMPHYSEMA

SIR —The reference to spontaneous surgical emphysema associated with labour, made by Dr F Bedo Hobbs in the *British Medical Journal* of May 24th (p 950) recalls an isolated and puzzling observation of my own, which seems worth mention in this connexion

Some time ago I saw in consultation an English child aged 12 who in the course of an attack of capillary bronchitis had suddenly presented a swelling of striking proportions on the left side of the neck The swelling was neither red, hot, painful nor tender and on palpation gave the characteristic crackle of surgical emphysema Subsequently the swelling spread to both sides of the neck head and chest, to the left arm and to the left side of the abdomen and vulva. It had completely disappeared within fourteen days The bronchitis was not associated with violent coughing there was no evidence of vesicular emphysema and the patient made an early and satisfactory recovery

The source of the subcutaneous collection of gas is a mystery —I am, etc,

R T WELLS,
Lieut.-Colonel I M S Civil Surgeon

Rawalpindi June 22nd.

ANTIMALARIA MEASURES

SIR,—Is there anything in this talk that malaria is to be reduced, in the first place, by improving the economic conditions of the victims?

We had no malaria in the hospital at Taranto when I served there in 1919 Was that because we were well fed, or was it because Colonel J C Robertson, I M S, and Sir Ronald Ross had had the area drained, cleaned, and oiled as necessary, and we ourselves were lodged in screened houses? Lord Allenby's troops were kept tolerably free from malaria through the summer of 1918 by antimosquito measures, but as soon as these well-fed and safeguarded troops were exposed to the myriads of female mosquitos in Northern Palestine half of them or more were down with malaria within three weeks People in flooded areas and swamps are always poorer than those on drier land, which is why they are driven to the swamps but it is better to give them free drainage than free meals, for they will make more money in their longer malaria-free time, and will buy the meals regularly for themselves We are told that ankylostoma-infested communities when cleared of this pest show a new energy and industry Not otherwise probably, will the southern European nations, freed from the malarial oppression which for so long has settled on them and blighted them, develop a new energy and courage, proving themselves perhaps the equals or superiors of the northern nations who live less in the life-giving sunlight

What Lieut.-Colonel Gill calls the new school seems to me to be the older, for it goes back to the old methods I recall from the eighties, when new settlers drained an area for amenity merely, with no direct intention of limiting mosquitos thereby It then took three men, successively, to achieve what one man may do now, but by the time it was done by the last the other two were invalided home or dead People who do not remember the old times cannot imagine what increased comfort and life we have derived from Sir Ronald Ross's discoveries and the teachings of the antimosquito school Before his time malaria was supposed to be due to climate we could do nothing to prevent it, and were laughed at if we tried —I am, etc,

W E HOME,
Fleet Surgeon.

London W 1 July 8th

Obituary

COLONEL JOHN RICHARD DODD, late R A M C (ret), died at Bournemouth on June 11th, aged 72 He was the son of Dr T A Dodd of Ryton, co Durham and was born there on May 18th, 1858 He was educated at Barts and at Newcastle-on-Tyne, where he gained the Dickinson, Tulloch, and Heath Scholarships at Durham University in which he graduated as M B in 1879 He also took the M R C S in 1879, and subsequently the F R C S in 1895 and the D P H of the London Colleges in 1899 After filling the post of house-surgeon of Newcastle-on-Tyne Infirmary he entered the Army as surgeon on February 5th, 1881, becoming lieutenant-colonel after twenty years' service, and colonel on September 9th, 1903 He retired on October 12th, 1912 He served in the Ashanti expedition of 1896 and received the star given for that campaign He was the author of the article on Ambulance in the *Encyclopaedia Britannica*, of Diseases of Soldiers in *Dangerous Trades*, and of numerous articles in the *British Medical Journal Graphic*, *Sporting and Dramatic News*, and other periodicals He was greatly interested in natural history and archaeology, was a keen fisherman, and a good shot In 1914 he went to Trinidad under the Rockefeller Commission to investigate ankylostomiasis in the Indian population, but returned to England to rejoin on the outbreak of war, and was re-employed from February 17th, 1915, till the end of the war After the armistice he settled in Bournemouth, where he devoted himself to archaeology and to the public service, being one of the early organizers of the National Citizens' Union, and a member of the Royal Empire Society and of the Bournemouth Natural History Society In 1897 he married the eldest daughter of Mr J W Cross general manager London and Provincial Bank who survives him, with one son, Captain T Dodd, R A M C

DR WILLIAM DAVID JOSEPH MORRIS an old Cardiff practitioner, died suddenly at his home on July 5th Although he had been in indifferent health for some time he was up and about to the last attending a county cricket match only the day before Born in 1860 at Fishguard, Pembrokeshire, he was educated at the local Grammar School, and at Long Ashton School, Bristol It was at Long Ashton, the home of the great "W G" and his brothers, that was engendered and developed Dr Morris's love of cricket and his skill at it He received his medical education at Guy's Hospital, obtaining the diplomas M.R C S in 1881, the L P C P Edin and L M in 1882, and the L S.A in 1883 After leaving Guy's in 1884 he settled in Cardiff, where he spent the whole of his professional career, building up an extensive practice He was a thoroughly capable family doctor, much respected and trusted by his patients He possessed a high degree of manipulative skill, and had he been more ambitious might have become quite a good surgeon, as it was he had many major operations to his credit He was not a great reader, being essentially an "outdoor man" His interests were many and varied He was a very keen sportsman and an excellent shot especially with the rifle In his early days Dr Morris was an ardent follower of hounds and was associated with three different Hunts in the county he was equally enthusiastic in support of cricket and Rugby football A connoisseur of no mean order he had a large collection of curios and antiques Among his many activities was Volunteering, and when the Volunteers were disbanded he retired with the rank of lieutenant-colonel He served also as major in the 2nd and 3rd Battalions of the Welch Regiment During the war he was in charge of the Mansion House and the St Pierre Voluntary Hospitals A prominent Freemason he was a Past-Master of his Lodge He resigned the appointment of medical officer to the Cardiff Post Office on reaching the age limit in April A colleague writes Among the many traits of his attractive and charming personality should be mentioned the love of both children and animals His influence over the latter was remarkable At one time

he possessed quite a menagerie in his bachelor home, among its denizens being such extremes as a fox and a python, both of which he had succeeded in taming He was a member of the Cardiff Naturalists' Society (Archaeological, Geological, Botanical, and Photographic Sections), an ex-president of the Cardiff Medical Society, and a member of the British Medical Association, being chairman of the Cardiff Division in 1925-26 He was a Justice of the Peace for Glamorgan

---

The death occurred on July 7th, at Victoria, British Columbia of DR PHILIP BRUNELLESCHI COUSLAND, who, as editorial secretary of the Chinese Medical Translation Committee for many years, may be looked upon as one of the "fathers" of modern medicine in China Born at Glasgow in 1861, he was educated at George Watson's College, Edinburgh, and Edinburgh University, graduating M B, C M in 1882 After holding the post of house-physician at Leith Hospital he went out to China under the *Presbyterian Church of England and the China* Medical Missionary Association to Swatow Hospital in 1883 Three years later he transferred to Chaochowfu, where he was superintendent of the Burns Memorial Hospital, and, until 1906, was engaged also in evangelistic and other work, including a great deal of translation He then removed to Shanghai, his services being lent to the China Medical Missionary Association (now the China Medical Association) for the purpose of editing, translating, and publishing medical books in Chinese, he was president of the association from 1910 to 1913 In 1890 Dr Cousland had become a member of the terminology committee of the association, and the bulk of its work fell upon his shoulders It largely lay with him to render into Chinese ideas and words wholly foreign to that language The ideographs had each to be considered separately by the committee before they were adopted or improved and finally used in the translation of foreign medical works The Chinese Government eventually itself took part in this task, and appointed a special committee on which the Medical Missionary Committee was represented Dr Cousland was the author of the *English-Chinese Medical Lexicon*, and he translated Osler's *Practice of Medicine*, Halliburton's *Physiology*, and Younger's *Insanity in Everyday Practice* Though he retired from active work some years ago, he remained on the "honorary list" of his society Having settled at Victoria, British Columbia, where his younger son was in medical practice, he continued until recently to visit Shanghai and Japan from time to time in connexion with medical translation work

---

We regret to record the death, on July 19th, of Dr T OUTTERSON WOOD, at his residence at Torquay He was born at Rainton, Durham, in April, 1843, and received his medical education at the Newcastle School of Medicine and at St Bartholomew's Hospital He became M R C S Eng in 1868, F R C S Ed in 1874, F R C P Ed in 1879, M D Durh in 1886, and M R C P Lond in 1888 After holding a resident appointment at the Royal Infirmary, Newcastle-on-Tyne, Dr Outterson Wood decided to take up psychiatry as a specialty, and was appointed resident medical officer at Dunston Lodge Asylum, Newcastle-on-Tyne That post he relinquished to become assistant medical officer to the Kent County Asylum, Barming Heath On the recommendation of the Commissioners in Lunacy he was next appointed medical superintendent of the Isle of Man Government Asylum In 1883 he commenced consulting practice in London, and was elected physician to the West End Hospital for Nervous Diseases, Epilepsy, and Paralysis, and to the St George's and St James's Dispensary Dr Outterson Wood was president of the University of Durham Medical Graduates' Association in 1897 and of the Medico-Psychological Association of Great Britain and Ireland in 1905-6 He took a keen interest in the work of the British Medical Association, and was president of the Medico-Psychological Section of the Annual Meeting in Belfast in 1909 He was also in former years a frequent contributor to the editorial columns of this *Journal* On relinquishing practice some fifteen years ago he retired to Torquay His recreations were trout fishing and shooting, in the first of which he was very adept His wife died in 1907

MISS CATHERINE JANE WOOD died on June 14th, at Hazel Rough, near Hartfield, Sussex, aged 88 She was very infirm, with her sight and hearing almost gone, and she suffered from severe rheumatoid arthritis She was born in Doughty Street, London, and most of her active life was spent in London She received her training in nursing under Dr Charles West at the Hospital for Sick Children, Great Ormond Street, and was connected with that hospital and its convalescent branch at Highgate for over fifty years She belonged to a group of highly endowed ladies who, without any pecuniary award, gave splendid service during the early and middle periods of the hospital's history, she ultimately became lady superintendent at Great Ormond Street When her work there was completed she gave unstinted service in several forms of activity concerned with sick-nursing She was the first to start a hostel for private sick-nurses, in which nurses themselves had shares, and she took part in the formation of the British Nurses' Association and of the Invalid Children's Aid Association With Miss Spenser Perceval (Mrs Howard Marsh), she was a founder of the Alexandra Hospital for Children with Hip Disease In 1892 she investigated, at the request of the *British Medical Journal*, the nursing conditions in English workhouses, and also the arrangements for looking after old people in workhouses This was followed by a like investigation of the workhouses in Ireland Miss Wood's reports were published in the *Journal* in 1894, and they had no mean share in bringing about reform She wrote an excellent guide to nursing in children's diseases, and an article in Quain's *Dictionary of Medicine* on children's hospitals Miss Wood was a woman of high moral purpose, of great strength of character, of intellectual vigour, and of unwearied self-sacrifice She will never be forgotten by those who worked under her and with her, side by side in many activities

THE LATE DR FRANK F TAYLOR

DR HERBERT R SPENCER writes There is an important omission in the obituary notice of the late Dr Frank E Taylor which I would like to supply I allude to his work as director of the "Review of Current Literature" in the *Journal of Obstetrics and Gynaecology of the British Empire*, a post he occupied for many years, up to the time of his death This work, which, though in poor health, he carried out most admirably and unselfishly, will always keep his name in grateful memory by British gynaecologists

---

The Services

CONDITIONS OF SERVICE IN THE R A M C

DR F E FREMANTLE, M P, sends us for publication a copy of the following letter, dated July 14th, 1930, which he has received from the Secretary of State for War

"With reference to your letter of June 19th, with which you sent me copies of letters on the subject of conditions of service in the Royal Army Medical Corps, I am writing to let you know that I am going into these questions, but you will, I think understand that it will take time, and I cannot, as you suggest, make improvements to take effect this month I think that the whole matter must be considered in connexion with next year's Estimates, and that I shall not be able to make any announcement in advance of my Estimates speech"

Dr Fremantle asks us to add that the "copies of letters" referred to by Mr Shaw were sent to him as typical complaints, without any indication of the writers' names and addresses In no instance has Dr Fremantle revealed the identity of the officers who have written to him on the subject

---

LIEUT GENERAL H B FAWCUS, Director General Army Medical Services, will open the museum of the 47th (2nd London) Division R A M C (T A), at the Duke of York's Headquarters, Chelsea, to day (Saturday, July 26th), at 4 p m

Medical Notes in Parliament

[FROM OUR PARLIAMENTARY CORRESPONDENT]

THE Navy Estimates and the vote for the Board of Trade have been considered in the House of Commons this week. There were further discussion on the Finance Bill and other measures.

The Parliamentary Medical Committee met for the last time this session on July 22nd. After considering the proceedings at the recent meeting between the Minister of Health and its representatives the committee decided that its views regarding a central body to co-ordinate the work of rheumatic clinics would be met if the Minister appointed a Rheumatism Council of the same type as the Cancer Committee. The Medical Committee further held that this council should include practitioners actually in practice and treating rheumatic cases. The committee further discussed the requests for the issue of test prescriptions by panel practitioners. It held that for the Ministry of Health to demand such issue was *ultra vires*.

In the House of Lords on July 21st the Housing (No. 2) Bill passed through committee with amendments.

In the House of Lords on July 22nd, the Housing (Scotland) Bill was read a second time.

In the House of Commons on July 22nd the Road Traffic Bill was read a third time. It has already passed the Lords.

Ophthalmic Benefit.

In the House of Commons on July 15th Mr. WOMERSLEY moved that an address be presented to the King praying that Regulation 25 of the National Health Insurance (Additional Benefits) Regulations 1930 dated June 18th 1930 be annulled. The regulation he said dealt with additional benefits for insured persons respecting ophthalmic treatment and the supply of optical glasses. He objected to the portion of the regulation which read:

> Where a member has submitted himself to the examination of a medical practitioner under the scheme of a body or organization which provides both ophthalmic examination and optical appliances he shall not be entitled to obtain the appliance prescribed by such practitioner from an optician who is not associated with that body or organization.

Under the present arrangements they had a body of qualified opticians known as the Joint Council of Qualified Opticians. They had been prescribing for some considerable time for members of approved societies and the arrangement had worked very satisfactorily. But another body had come along. Whenever a member of the Qualified Opticians Council examined a patient and found that he required surgical treatment he immediately reported to the approved society and arrangements were then made for the patient to be examined by an ophthalmic surgeon. The ophthalmic surgeons had set up a board known as the National Ophthalmic Treatment Board and they had taken on to that board certain selected firms which supplied optical glasses. They had gone to the Ministry of Health and requested that they should be given special privileges for that particular board. This question was raised in 1928 when the *National Health Insurance (Amendment) Act* was before the House and various objections to the proposed arrangement were put forward. The approved societies now wanted to know why this change-over should be made. Throughout the United Kingdom there were thirty firms attached to the National Ophthalmic Treatment Board but 90 per cent. of those were in the hands of four firms only which had branches scattered throughout the country. If the regulation was passed they would be the only people available to make up the glasses required by members of approved societies. It was not fair to bring in this drastic change buried in the midst of many new regulations which it might be desirable to introduce. Before any such action was taken a round table conference of all the parties concerned ought to have been held. If the regulation was passed the position would be that a member of an approved society would come to a member of the organization that had hitherto supplied him with glasses and the doctor realizing that the defect required something more than the attention of a refractionist, would say, "You must go to a surgeon." The man would be reported back to the society which would send him to a surgeon. That surgeon could not send him back to have the prescription made up by the person who first called attention to the defect. He would have to go to one of the members of this favoured board. The approved societies said that the members ought to have a free choice to go to qualified and approved men.

Mr. BIRD seconded the motion.

Mr. GREENWOOD said that he did not know what case he had to answer. No drastic changes had been made. These regulations were formulated only after full consultation with the Approved Societies Consultative Council of the Ministry. For years there had been two different schools of thought on this question of ophthalmic treatment. There was what he might call the view of the medical profession and there was the view expressed by the Joint Council. He was not concerned with conflicting professional interests. His concern was service to the members of approved societies. It was his duty to hold the balance as fairly as he could and to give the maximum number of alternative opportunities for service to insured persons. That was done under the regulation now being discussed. Under it any approved society was to be free to make its normal arrangements if it was providing ophthalmic treatment directly with a representative body of opticians and in the majority of cases that course would be followed. The regulation allowed a society to arrange for examination in all cases by ophthalmic surgeons. There were two other alternatives which had been designed to make it possible to get advice from ophthalmic surgeons and to provide that service at a minimum cost. The British Medical Association had made two alternative schemes. In the first one it had prepared a list of medical practitioners who had had experience of dealing with ophthalmic cases and were willing to test the sight of insured persons and prescribe glasses. The insured person having got his prescription could go to any qualified optician he chose throughout the length and breadth of the land. The second scheme was a combined one being an arrangement between the medical profession on the one hand and—it was quite true—a body not representing a large number of firms the Association of Dispensing Opticians on the other—firms he imagined to which most members of the House of Commons went when they had their prescription made up. They never prescribed, but always made up prescriptions which came to them from ophthalmic surgeons. Under that combined scheme it was quite clear that they could not have that free choice of opticians that was available under other schemes. If they had the scheme would go to pieces. It was reasonable to say to an insured person: "If you wish to go to an ophthalmic surgeon if you feel that your eyesight needs highly skilled advice then we have got to tell you that there are only a limited number of opticians to whom you can go to have your prescription made up." That did in a way interfere with the free choice of the insured person but he acted with his eyes open. The insured person need not have this scheme unless he wanted it. He hoped the House would pass these regulations as provisional regulations for the benefit of insured persons.

Mr. RHYS DAVIES said that there was now freedom of choice on the part of the insured person to go to either a panel practitioner a dentist or a chemist. The insured person also had freedom of choice up to the present to choose his optician but by passing these regulations that freedom of choice for the insured person would be taken away. It would be well if the Minister of Health would take this part of the regulation back.

Dr. MORRIS-JONES said that if the regulation was deleted according to the motion it would certainly take away whatever choice there was to the insured person. What were the two schemes before the House? An insured person could go to an optician who was a member of this organization and get his eyes tested and he could get glasses for a fee of 15. He could under the scheme of a National Ophthalmic Treatment Board go to a specially qualified man approved by eminent ophthalmic surgeons appointed by the Board specially qualified to examine eyes for an inclusive fee of 18s.—namely 10s. 6d. for the examination and 7s. 6d. for the glasses—compared with the 15s. which he paid under the other scheme. Surely the House was not going to deprive the insured person of the right of choosing which of the two he preferred. He hoped that the House would not deprive a large number of opticians of the opportunity of making a living.

The motion was rejected by 144 votes to 23.

Silicosis Bill.

The Workmen's Compensation (Silicosis) Bill was considered by a Standing Committee of the House of Commons on July 8th and 10th. *An amendment* to Clause 1 to include form of dust other than asbestos dust was ruled out of order and an amendment to Clause 2, to provide that the medical expenses fund should be maintained by subscriptions from employers was negatived. Dr. VERNON DAVIES proposed an amendment to apply the bill to "groups of industries and processes in which silica or asbestos is used industrially." He withdrew the amendment after Mr. SHORT pointed out that Parliament sought to provide for workers who were exposed to dust even if that dust were not used industrially. Dr. FREMANTLE spoke of the value of employing under the scheme *medical men* who were in general practice instead of only employing whole time officers. A man who gave up his life to examining people suspected of silicosis or a bestosis would make mountains out of molehill. Mr. SHORT said that the Departmental Committee appointed to advise the Home Secretary about these medical arrangements did not share Dr. Fremantle's view. The committee was satisfied that encouragement and facilities would be given these officers to keep themselves up to date in all medical science. Discussion followed on the position under the bill of men working in coal mines and affected with silicosis where there is not 50 per cent. of free silica in the dust. Mr. SHORT said that where the Home Secretary believed there was a risk of silicosis he could apply the compensation schemes without regard to the 50 per cent. limitation.

The bill came before the House of Commons on July 15th, when it passed through report and was read a third time.

In the House of Lords on July 22nd a Commons amendment to the Workmen's Compensation (Silicosis and Asbestosis) Bill, was, on the motion of Earl RUSSELL accepted.

Small pox

Mr GREENWOOD in reply to Mr Broad, stated, on July 17th, that no deaths from small pox were registered during 1929 in Norway, Sweden, Germany Switzerland Austria Denmark or France There were 3 deaths in Spain during 1929 and 5 deaths in Italy in 1927 No particulars were available in regard to Russia

Replying to Mr Groves, on July 21st Mr GREENWOOD said that in the fifty two weeks ended December 28th 1929, 39 deaths occurred in England and Wales which were classified as due to small pox Of these cases, patients aged 3 days, 14 days 3 weeks (two cases), 1 month, 2 months 8 months (two cases), 16 months, 2 years, 9 years, 13 years, 16 years 17 years, 24 years, 25 years, 31 years, 36 years, 37 years, 44 years 63 years 64 years and 65 years were not vaccinated The ages of the patients vaccinated were 14, 20, 28, 29, 34 36 42 43 45 (two cases) 59 61, 65 and 75 years In one person aged 65 years and one aged 74 the vaccinal condition was doubtful no information was available in the case of a person aged 66 years All those vaccinated had been vaccinated in infancy only, and were aged 14 years and upwards at the date of death

Indian Medical Degrees

Mr BENN replying to Major Polo on July 21st said that he had not yet received the views of the Government of India in regard to the resolution passed at the conference of representatives of the principal Governments and the medical faculties at Delhi, in June, requesting the Secretary of State to change the rules governing recruitment to the Indian Medical Service, so as to remove the provision that only persons holding degrees recognized by the General Medical Council in this country should be selected for the Indian Medical Service Dr FREMANTLE asked Mr Benn to do everything he could to insist that in any such change in the rules there should be no degradation of the Service that had done so much and was expected to do so much by keeping its standard up to the European standard Mr BENN said that he could make no statement until he had received the views of the Government of India

Tuberculosis—On July 1st last, 22,575 patients were receiving residential treatment for tuberculosis under the approved schemes of local authorities in England and Wales On the same date 3 232 patients had been awaiting admission to residential institutions for more than ten days Mr JOHNSTON informed Mr Marcus, on July 22nd, that the numbers of new cases of all forms of tuberculosis notified in Scotland in 1928 and 1929 were 10 885 and 10,262 respectively The number who received treatment in institutions in 1928 was 7 808 The corresponding figure for 1929 was not yet available The Department of Health for Scotland had no evidence to indicate that any material number of cases were not receiving treatment because of lack of accommodation

Tuberculosis in South Shields—Replying to Mr Tde, on July 17th Mr GREENWOOD said that a medical officer of his Department would visit South Shields shortly to investigate the prevalence of tuberculosis in the borough It would not be an official inquiry in public but all who had knowledge of the question would be consulted

Dangerous Drugs—Replying to Dr Fremantle, on July 17th, Mr CLYNES stated that it had not yet been possible to take steps to convene a preliminary conference of countries manufacturing narcotics, with a view to limiting their output He would consult on the possibility of summoning a meeting for October On the same date Mr MARLEY asked whether the Home Secretary would consider the fining of doctors who left dangerous drugs in open cars Mr CLYNES replied that steps had already been taken in regard to that matter

Drugs in Automatic Machines—Mr CLYNES told Dr Morris Jones on July 17th that he had seen a report of a case in which the legality of the sale of drugs of a poisonous character, procured from automatic machines outside chemists establishments in the county of London, had been raised where the judge decided that such sale involved a breach of Section 3 of the Poisons and Pharmacy Act, 1908 The proceedings for the recovery of a penalty under that Section were of a civil character and were instituted by the Registrar of the Pharmaceutical Society he had no power to intervene He understood the case in question was a test case arranged by the Pharmaceutical Society, and the judgement would no doubt be noted by those concerned

Infectious Fevers—In reply to Mr Broad on July 17th Mr GREENWOOD said that 3 388 deaths from measles were notified during 1929 in England and Wales, 29,084 from influenza, and 53 from chicken pox Of 120 232 cases of scarlet fever, 717 were fatal, of 62,774 cases of diphtheria, 3 446, of 10,967 of small pox, 39 and of 69,178 of tuberculosis, 37,990

Mental Deficiency—Replying to Dr Morris-Jones, on July 17th, Mr GREENWOOD said he could not undertake at the present time to appoint a commission to make full inquiries into the causation of mental deficiency, its relationship to other abnormal conditions and social problems, and any measures, including segregation and sterilization, by which it might be prevented

Undernourished Children—Sir C TREVELYAN stated, in reply to Mr McShane on July 17th, that, apart from the practical difficulties involved, he doubted whether any useful results would be gained from a comparative medical examination of representative groups of scholars consisting partly of children of men unemployed for some time and partly of children of those belonging to the regularly employed artisan class It was the duty of local education authorities to discover whether children were suffering from malnutrition In areas where industrial depression was acute special steps were taken to keep a close watch on the health of the children and to provide supplementary nourishment in cases of need Mr MCSHANE said that such a comparison was found to be of much value in Glasgow some years ago

Physical Training in Schools—The House of Commons, in Committee of Supply on July 14th, considered a vote for public education in Scotland Mr W ADAMSON moved the vote The Duchess of ATHOLL pointed out that the report on Scottish education stated that not enough physical training was given in the schools and that it was only taken on two or three days a week whereas the inspectors felt it should be every day If physical training was not being given as often as the inspectors thought necessary that pointed to a shortage of teachers In the past Scotland had not devoted much attention to the training of the small child and to the nursery classes Improvements in the health of the children between 1 and 5 years was of greater importance to the nation as a whole than an additional year of school life Mr COWAN said that the next great advance in Scottish education would be along the physical side, partly by practical work in the schools but more by development of the medical services and the provision of playing fields Sir I THOMSON said maternity and child welfare schemes covered only about one third of the children in Scotland The provisions under the Act of 1919 for special schools for children between 5 and 9 years who o mental and physical condition necessitated attention had not been greatly used Mr JOHNSTON replying for the Government said they all wanted to see physical teaching or training The vote was agreed to

Poison Gas—Replying to Mr Freeman, on July 17th, Mr SHAW said the results which had been obtained both during and since the war showed that experiments on animals at Porton gave definite evidence of the mode of action of poison gases on human beings Indications were also obtained of the curative treatment which should be adopted The knowledge gained had greatly alleviated human suffering during the war On July 22nd Mr SHAW, replying to Mr Freeman, in reference to the experiments conducted at Porton with poison gases on animals, said that a comparison of the gross and micro copic appearance of the lungs of men killed by irritant gases in France with those of animals exposed to the same substances showed that the injuries were of similar nature and character Further study of such animals gave evidence of the mode of action of the poisons and their effects on vital organs It was thus possible, by correlating these experiments with clinical observations on gas patients, to formulate curative treatments Descriptions and results of this research were published in the medical press shortly after the war

Universities and Colleges

UNIVERSITY OF LONDON

A MEETING of the Senate was held on July 16th A cordial vote of thanks was accorded to Sir Gregory Foster for the services he has rendered to the University during his tenure of the office of Vice Chancellor

Dr Samson Wright, lecturer on physiology at King's College, was appointed to the University Chair of Physiology at the Middlesex Hospital Medical School

Dr Alexander Robertson was appointed to the University Readership in Biochemistry at the London School of Hygiene and Tropical Medicine

The title of Professor was conferred upon Dr J G Thomson (medical protozoology) and Dr G S Wilson (bacteriology as applied to hygiene) in respect of the posts held by them at the London School of Hygiene and Tropical Medicine

It was resolved to institute a University Chair of Radiology, tenable at the Cancer Hospital (Free), Fulham Road

ROYAL COLLEGE OF PHYSICIANS OF EDINBURGH

A QUARTERLY meeting of the Royal College of Physicians of Edinburgh was held on July 15th, when the President, Sir Norman Walker, was in the chair

Lieut Colonel W P Harvey, C I E (Edinburgh) and Dr Arthur Oliver Gray (London) were introduced and took their seats as Fellows of the College

Dr H L Wallace (Edinburgh) Dr Wm Brown O B E (Aberdeen) and Dr H L Whittingham (Halton, Bucks) were elected Fellows of the College

It was announced that Dr D K Henderson (Glasgow) had been appointed Morison Lecturer for 1931

ROYAL COLLEGE OF SURGEONS OF EDINBURGH

AT a meeting of the Royal College of Surgeons of Edinburgh held on July 22nd, when Dr James Haig Ferguson, President, was in the chair, the following 22 successful candidates, out of 73 entered, having passed the requisite examinations this year, were admitted Fellows

M I Ashmawi P C E Brunette C Charleson A C Copley A Brython Davies J Dick C A Ferguson J P Galloway D M Gibson T J Gibson A H Holmes J B Hutchison C M Jennings L R Lalwani A C Melachern H I Masson J W Nimkivell H K Pavy W B Reantice E T S Rudd J D Thomson A L Young

The Ivison Macadam Memorial Prize, consisting of a bronze medal and a set of books, was after a competitive examinat on in organic chemistry, awarded to Mr E T Oon

Medical News.

THE Alvarenga prize of the College of Physicians of Philadelphia has been awarded to Dr H A Harris, assistant professor of anatomy, University College, and assistant to the Medical Unit, University College Hospital for an essay entitled "Cod liver oil and the vitamins in relation to bone growth and rickets"

THE Irish Medical Schools and Graduates' Association will hold its annual luncheon on Wednesday, August 27th at 1 p m , at the Marlborough Hotel, Winnipeg The President of the British Medical Association, Professor W Harvey Smith, will be the guest of the association The speakers will include three distinguished members of the profession in Dublin—Sir William de Courcy Wheeler, Professor T G Moorhead and Sir Robert Woods. The luncheon is open to any member of the medical profession, and guests, ladies or gentlemen, may be invited Tickets will be $1 each, and can be obtained at the B M.A. Registration Office. Seating accommodation is limited to one hundred and fifty Reservations will be held if application is made by letter before August 25th to Dr E S Moorhead, 314, Medical Arts Building, Winnipeg Dr Moorhead suggests that as there are many doctors of Irish descent who will want to hear their native language in its purest form, it is advisable to make reservations early

AS already announced in these columns, a new convalescent centre for 500 male patients has been established by the London County Council, which has purchased for this purpose Queen's Hospital Sidcup the name being changed to Queen Mary's Hospital by permission of the King and Queen On July 21st Princess Mary, Countess of Harewood, visited the hospital and opened it formally Dr Barrie Lambert, chairman of the Central Public Health Committee, gave an account of the way in which the hospital had been obtained and modified for the new purposes to which it will be put After various presentations to Princess Mary, she was conducted through the hospital wards by Dr Clifford Ellingworth, the medical superintendent

AT the July meeting of the Central Midwives Board for England and Wales the following resolution from the Liverpool and District Trained Midwives Association was received "That the suggestion to transfer powers of approval and control of training schools and teachers from the Central Midwives Board to a Government department be strongly opposed"

A CIVIL List pension of £70 has been awarded to Miss Katherine Mary Lovell Gamgee, M R C S., L.R C P , D P H , in recognition of the services rendered by her father, the late Professor Gamgee, to medicine and physiology, and of her work in connexion with public health

THE fifth ordinary general meeting of the Ross Institute and Hospital for Tropical Diseases was held at the Institute Putney Heath on July 9th, when the chairman, Sir Charles McLeod, presented the annual report and accounts for 1929 In connexion with research mention was made of the continued investigation of fungi and fungal diseases. The new malaria department had become a very popular centre for advising medical practitioners and laymen A branch of the institute had been established in Assam the expenses having been guaranteed by various planter companies Work had begun in connexion with the supply of information and advice towards the improvement of health on the tea estates, scientific work would also be conducted there on the prevention of malaria. Courses of instruction for laymen had been continued at the Institute on Putney Heath, and the applications for the third course, to be held next September, were more than double those of the two courses held last year A pamphlet on the prevention of malaria was being distributed, and a special donation had been received towards the expenditure thus incurred Tribute was also paid to the long continued research work of Dr J A Shaw Mackenzie in connexion with the cancer problem

THE annual conference of the National Smoke Abatement Society will be held at Leicester on September 26th 27th, and 28th Dr Margaret Fishenden will make a communication on fuel research and smoke abatement, a meteorologist will discuss smoke and the weather, and a report by the Sheffield Manufacturers Smoke Abatement Research Committee will be considered

THE thirteenth International Congress of Hydrology Climatology and Medical Geology will be held at Lisbon from October 15th to 23rd. During the congress visits will be paid to the more important towns and spas of Portugal, and an excursion will be made to the Azores and Madeira. Further information can be obtained from the Faculty of Medicine, Lisbon

THE Italian League for Combating Cancer has offered a prize of 15,000 lire for the best unpublished work on the value of serological methods in the diagnosis of malignant tumours Two typewritten copies of the work should be sent by competitors before June 30th 1931, to the Lega Italiana per la lotta contra il cancro, Via Tribonland, Piazza Cavour, Caso del Matdato, Rome

THE returns of vital statistics dealing with non native officials employed in the Crown Colonies in West Africa in 1929 contain evidence of an improved standard of health The rate representing officials invalided out of the service fell from 11 7 per 1,000 in 1928 to 10 1 in 1929 which is the lowest figure recorded A rise from 6 7 to 7 7 per 1 000 is reported in the death rate No deaths occurred in Gambia during the year, but the rate in Sierra Leone rose from 3 7 in the previous year to 14 1 Slightly higher figures were also recorded in the Gold Coast and in Nigeria Of the total of 33 deaths 27 were attributed directly to diseases, but only a minority of these appear to have been of a tropical nature Six deaths were caused by blackwater fever The rate per 1 000 in respect of deaths caused by disease was 6 3 in 1929, compared with 11.6 in 1919

WE have received the first two issues (January–February and March–April) of *Archivio Italiano di Anatomia e di Istologia Patologica*, which is published bi monthly by the Royal Institute of Pathological Anatomy of the Ospedale Maggiore Milan under the editorship of A Dionisi of Rome A Pepere of Milan, and F Vanzetti of Turin. Each issue contains original articles and synthetic reviews, with summaries in German French, and rather imperfect English, case reports, and abstracts

A TABLE has been issued by the Ministry of Health based on the returns made by the Poor Law authorities in England and Wales comparing the average number of persons receiving poor relief in April, 1930 with the number recorded in April 1914 In April, 1930, the average number (including both sexes) in receipt of outdoor relief mainly on account of unemployment was 130,100 while those to whom relief was granted for some other cause such as sickness, numbered 606 500 This classification is not available for 1914, but the number receiving unemployment relief at that time is stated to have been almost negligible In April 1930, the total number in all classes was 736,600 compared with 373,400 in 1914—an increase of 363 200 The Ministry adds that the number recorded in April of this year was less by 121,500 than that recorded in the previous month A decrease of 103 800 (or 44 per cent) in the number of those receiving relief mainly on account of unemployment (including their dependants) is attributed largely to the operation of the Unemployment Insurance Act which affected the distribution of unemployment benefit from the middle of March The figures given above do not include 10,000 persons in receipt of medical relief only in their own homes. In 1914 the average amount of outdoor relief, estimated per person, was 2s. 6d , compared with 5s 9d in April 1930 (about 3s. 2d , allowing for the increased cost of living) Persons receiving institutional relief—other than lunatics in asylums and casuals—numbered 254 900 on a day in April, 1914 compared with 211,900 on the corresponding day in April, 1930 This number is stated to be 12,000 less than the total number recorded in March, 1930

THE Harrogate Medical Society has compiled a short account of the nature of spa treatment incorporating a description of the Harrogate waters and baths and the accessory lines of therapy which are employed The pamphlet, which is addressed to the medical profession only, may be obtained from the general manager the Royal Baths, Harrogate

WE have received the first issue of *Les Echos de la Medecine* a monthly journal published by Malone of Paris in the form of a daily newspaper at the price of 50 centimes. It contains short articles on medical questions of the day congress and society reports and medical news.

THE alphabetical and local list of old students of St Thomas's Hospital has been brought up to date and republished in pamphlet form together with lists of past and present officers of the medical school and of winners of scholarships and medals Copies may be obtained from the medical secretary at the hospital

LIEUT COLONEL E. M COWELL, D S O R.A M C. T A., has been appointed a Deputy Lieutenant for the county of Surrey

PROFESSOR FRITZ PREGL of Graz has founded a prize for the best work on microchemistry

DR. KARL SUDHOFF, formerly professor of the history of medicine at Leipzig has been elected a foreign member of the Hungarian Academy of Sciences at Budapest

DR. LEMOINE, formerly professor of clinical medicine at Lille has made a donation of 50,000 francs to the Lille medical faculty

Letters, Notes, and Answers.

All communications in regard to editorial business should be addressed to ***The EDITOR, British Medical Journal, British Medical Association House, Tavistock Square, W C 1***

ORIGINAL ARTICLES and LETTERS forwarded for publication are understood to be offered to the *British Medical Journal* alone unless the contrary be stated Correspondents who wish notice to be taken of their communications should authenticate them with their names not necessarily for publication

Authors desiring REPRINTS of their articles published in the *British Medical Journal* must communicate with the Financial Secretary and Business Manager, British Medical Association House, Tavistock Square, W C 1, on receipt of proofs

All communications with reference to ADVERTISEMENTS as well as orders for copies of the *Journal* should be addressed to the Financial Secretary and Business Manager

The ***TELEPHONE NUMBERS*** of the British Medical Association and the *British Medical Journal* are *MUSEUM 9861, 9862, 9863,* and *9864* (internal exchange, four lines)

The ***TELEGRAPHIC ADDRESSES*** are

EDITOR OF THE *BRITISH MEDICAL JOURNAL, Articulate Westcent, London*

FINANCIAL SECRETARY AND BUSINESS MANAGER (Advertisements, etc), *Articulate Westcent, London*

MEDICAL SECRETARY, *Mediscern Westcent, London*

The address of the Irish Office of the British Medical Association is 16 South Frederick Street, Dublin (telegrams *Bacillus, Dublin*, telephone 62550 Dublin), and of the Scottish Office 7, Drumsheugh Gardens Edinburgh (telegrams *Associate, Edinburgh*, telephone 24361 Edinburgh)

QUERIES AND ANSWERS

KEEPING FIT IN HOT CLIMATES

"C H B writes from Malta I should be grateful if someone would enlighten me on several points that arose during a discussion on keeping fit in hot climates, or alternatively recommend some small handbook covering the matter First, the question of alcohol My friend, who has spent many years in tropical countries maintains that a good ration of gin daily is essential to health, and that the total abstainers are the first men to go sick Secondly, even in climates such as this he says it is very unwise, and inviting the mild intestinal disorders which are so common, to sleep without a good covering over the lower abdomen Lastly the question of exercise He maintains that to keep fit one must indulge in some violent form of exercise every day, such as five sets of tennis, which causes a tremendous sweat He will not accept a long swim as equal value in exercise because no beneficial results are obtained from the exercise unless it makes one sweat These theories are postulated from twenty years' practical experience of hot countries, and I am not in a position, after an ordinary medical education, to accept or refute them He and his kind have a strong bias in favour of alcohol, and it seems to me that they persuade themselves, and anyone else who will listen to them, that alcohol is a good thing, and then have to make themselves sweat In short, in the Mediterranean climate, would it not be better to live a non alcoholic life and swim, rather than an alcoholic life and have to play tennis and medicine ball?

BROMIDROSIS

'D B M" writes If "R B C will try a strong foot bath of potassium permanganate for the boy with bromidrosis the results will be satisfactory The exact strength cannot be stated, as each case differs, but if the solution gives a mild "tanning" colour to the feet the smell disappears The patient can be given the crystals, and use *his own discretion as regards* the strength of the solution

CLEANSING OF THE CHALICE

"R" writes In my opinion 'Medicus" (July 19th, p 128) has raised a very important question It would certainly be very difficult to prove a case of infection, but this fear does without doubt exist in the minds of devout and reflecting communicants The difficulty would be solved if the clergy could be persuaded to administer the sacred rite by the method known as intinction I cannot discover that intinction is contrary to the Rubric but *perhaps some ecclesiastic with medical training will enlighten us*

INCOME TAX

Retirement of Partner, Cash Basis

"G P explains that X and Z have been in partnership for some years on a basis of half shares, and tax has been accounted for on the cash basis Y retired in June 1929, Z anticipates some fall in the profits of the practice Since Y's retirement a sum of, say, £2 000 has been collected in respect of previous partnership bookings How should the matter be dealt with as between Y and Z?

*** We assume that it is intended to continue the cash bookings basis for future returns, in the long run probably little advantage would be gained to compensate for the inconvenience of changing over to the bookings basis If—as may be the case—Y's retirement led to swollen receipts during the following twelve months, Z is affected adversely for the time being, but it is impossible to estimate such loss with sufficient accuracy to enable it to be allowed for in dividing the income tax liability The plain fact is that up to his retirement (say at July 5th, 1929) X was entitled to one half the profits, and therefore the assessment for the year to April 5th, 1930, should be divided thus—X one fourth of one half = one eighth, and Z, seven eighths The cash receipts of the year 1929 will determine the assessable profit for 1930 31, and if Z enters into partnership with X during that year a similar division will bring him some converse relief

Car Allowance

R C bought a W car in 1926, paying £612, less £235 allowance in respect of his previous car In 1929 he bought an H car, price £518 less £123 received for the W car What claim should he make for 1930-31?

*** Apparently depreciation allowance has not been claimed in the past, though it would apparently have been to "R C's" advantage to do so The obsolescence claim, the amount to be treated in the same way as an expense of the year 1929, would be £612–£123=£489 and the depreciation claim will be £518 at 20 per cent =£103 "R C may, however, meet with the difficulty that, especially as depreciation has not been claimed, the "obsolescence" allowance is, in effect, the same as an allowance in respect of cost of replacement, and *that* allowance cannot be claimed for the same year as depreciation

LETTERS NOTES ETC

FORTICN BODY IN CHILD'S VAGINA

DR A L CROCKFORD *M C* (Axminster, Devon), writes A fairly well grown child, aged 7, was brought to me by her mother with the history of vaginal haemorrhages and a persistent yellowish discharge of some few weeks' duration None of the haemorrhages was at all severe, they were only sufficient to stain her clothes to a marked extent they all occurred in the early stages The child was attending school and appeared to be of perfectly normal mentality There was nothing to suggest any form of "assault" in either the history or on external examination I therefore examined her under a general anaesthetic and found lodged in the vagina an ordinary hairpin with the rounded end uppermost One of the points was embedded in the anterior vaginal wall, which presumably was the site of the occasional haemorrhages The hairpin was removed without much difficulty and the discharge has since completely disappeared It is surprising that with such an object in the vagina the child should have had no apparent pain or discomfort The case illustrates the value of a thorough examination in elucidating an obscure symptom

APICFCIAL LOBAR PNEUMONIA

DR NIAZ MOHAMMED (Kitgum, Uganda) writes A Nubian woman, aged about 45, came on April 16th to the out patient department of Kitgum Hospital complaining only of slight cough, expectoration, and pain in the right chest From her external appearance it appeared she was not seriously ill in any way, but after a few more gravely ill patients had received attention, I examined her and found definite signs of the consolidation stage of lobar pneumonia in the right lower and middle lobes Her temperature, however, was only 98° She was admitted to hospital and given the routine treatment for pneumonia, six days later she was discharged completely cured

EARLY DENTITION

DR H R SPARROW (resident medical officer, Leeds Maternity Hospital) writes I recently had a case of a premature baby, gestation period 37 weeks, and measuring 18½ in, who possessed two lower central incisor teeth at birth The teeth were comparatively firm in the gum when the infant left hospital twelve days later.

A WARNING

'POLICY' writes May I warn practitioners in South West London that there is a superintendent attached to a well known insurance company who canvasses doctors and offers them a medical refereeship on condition that they take a substantial endowment policy with the company He states that the appointed practitioner is the sole referee for the district, and that he can easily pay his premium out of the fees he will obtain I know several men who have been appointed in this way, and they do not get more than about six cases a quarter Before being persuaded, practitioners should make certain that they are the "sole' referee for the district

VACANCIES

NOTIFICATIONS of offices vacant in universities, medical colleges, and of vacant resident and other appointments at hospitals, will be found at pages 35, 36, 38 39 42, 43, and 44 of our advertisement columns, and advertisements as to partnerships, assistantships, and locumtenencies at pages 40 and 41

A short summary of vacant posts notified in the advertisement columns appears in the *Supplement* at page *63*

EPITOME OF CURRENT MEDICAL LITERATURE

Medicine.

71 Congenital Tabes and General Paralysis

F R FERGUSON and M CRITCHLEY (*Brit Journ. Child. Dis.*, January-March, 1920, p 1) record their observations on 36 patients suffering from congenital neuro syphilis, 8 of whom were tabetics, 12 tabo-paretics, and 15 cases of general paralysis, while one belonged to no definite category The chief points of importance in congenital tabes are as follows The age of onset is about puberty the symptoms including failing vision and paraesthesia, though severe lightning pains and ataxia are rare Headache, photophobia and diplopia are common later symptoms, but sphincter disturbances were uncommon in the authors series Apart from slight mental dulling, there was no psychological abnormality, and the sensory loss and ataxia were slight compared with tabes in the adult Nystagmus was present in 3 cases, and there were the typical pupillary abnormalities, dilated pupils were found in half the cases. *Trophic disturbances were rare No crises were encountered* Tendon reflexes were absent or much diminished Strabismus was found in half the cases, and optic atrophy was frequent The characteristic features of congenital general paralysis as distinct from general paralysis in the adult were (1) the early age of onset, (2) association with infantilism and signs of visceral syphilis, (3) frequency of optic atrophy, (4) early appearance of bladder symptoms, (5) dilated pupils which are often inactive, (6) contractures in arms and legs, (7) a different psychological picture, and (8) a more rapid course

72. Allergy in the Symptomatology of Typhoid Fever

COMMENTING on the part played by allergy in giving rise to symptoms in typhoid fever, J DELALANDE (*Paris Méd*, May 17th, 1930, p 457) discusses particularly the three clinical signs of rose spots, splenomegaly, and the pseudo-malarial rise of temperature at the time of defervescence He considers that the rose spots are due to a bacterial embolism in the capillaries of the skin, this is probably favoured by the development of agglutinins in the serum, and perhaps also by local reflex dystony in the lumbar abdominal region He does not think that it represents any specific sensitization As regards the causation of the splenomegaly three factors are adduced—namely, infestation of the spleen with Eberth's bacillus, the action of its toxins, and a specific reaction of the parenchyma of the spleen to typhoid antigen Vincent claims that this last reaction is diagnostic, having obtained an increase of 1 to 2 cm in the two diameters of the spleen in 94 per cent. of enteric cases by the hypodermic injection of lysed Eberth s bacilli sterilized by the addition of ether The author accepts Bouveret s explanation of the increase in temperature at the period of defervescence, that it is protein shock due to the discharge into the blood stream of quantities of lysed Eberth s bacilli.

73 Epilepsy and Migraine.

S BROCK (*New York State Journ of Med*, April 15th, 1930, p 442) discusses the relationship of the sympathetic nerve system to epilepsy and migraine, and, in particular, the question whether these paroxysmal disorders are directly due to its disturbed function, or whether certain symptoms are merely expressions of its abnormal function irrespective of any causal connexion In epilepsy the production of a convulsion may be due to contraction of the cerebral arteries under sympathetic stimulation, thus resulting in decreased capillary flow with deficient oxygenation and a consequent alkalosis of the brain tissue, there may be an increased outward passage of fluid through the capillary walls and the appearance of oedema It is conceivable that some or all of these factors (lack of oxygen, alkalosis, oedema, altered electrolytic equilibrium and increased intracranial pressure) might stimulate nerve cells to discharge and produce muscular spasm The apnoea and muscular contraction would result in an accumulation of lactic and carbonic acids in the tissues, producing an acidosis initiating a reserve reaction, with better utilization of oxygen, restoration of the circulation and remission of the muscle spasm Thus abnormalities in the sympathetic system may have a causal relationship to the production of the convulsive state As regards the possibility that the paroxysmal symptoms of migraine may be directly due to an altered function of the sympathetic system Brock remarks that the condition may be regarded as a vasomotor disturbance due to a variety of stimuli acting thereon and resulting in vasomotor spasm He concludes that both in epilepsy and in migraine there is ample evidence of such disturbed function, with involvement of the cerebral vascular mechanism as the essential factor in the attacks, it is uncertain whether they are caused by indirect nervous or direct physico-chemical influences, and the main etiological factors are unknown.

74 Poliomyelitis in Madrid.

M TAPIA (*La Med Ibera* May 10th and 17th, 1930, pp 621 and 657) records his observations on 112 cases of poliomyelitis under his care during the epidemic at Madrid in the autumn of 1929 The highest incidence was in children under 2 years of age (75 per cent) The period of invasion ranged from a few hours to ten days, the average being from one to five days There was no typical symptom during this period by which the disease could be diagnosed, although the poliomyelitis might be regarded as probable in 20 per cent., and suspected in another 10 per cent During the paralytic stage fever was found to be present in 45.55 per cent The great majority of the cases (103) showed the typical spinal localization *There was only one instance of the pure bulbo-pontine form*, five others belonged to the bulbo-pontine variety, and two to the mesocephalic form described by Marinesco Although meningeal symptoms were frequent, 13 per cent having been noted in the period of invasion and 25 per cent in the paralytic stage, no pure meningeal form was observed Only two cases were seen which could be diagnosed with certainty as examples of the abortive form of the disease The most constant and earliest change found in the cerebro-spinal fluid was Lange s curve, which is intermediate between that of latent syphilis and tabes The mortality was only slightly above 2 per cent As regards functional prognosis, 30 per cent of the cases showed complete recovery, and in another 30 per cent. there was partial recovery from the paralysis

75. Infantile Eczema and Measles.

G COSTANTINO (*La Clin Pediat*, March, 1930, p 215) reviews the literature and records three cases of infants, aged from 4 to 5 months, who had suffered for some time from facial eczema, which, however, rapidly and permanently disappeared after an intercurrent attack of measles. Costantino attempts to explain the curative action of measles by attributing special importance to the age of the patient and to changes in the systemic and cutaneous neurochemistry produced by measles. Injections of measles convalescent serum did not have any effect, however

Surgery.

76 Phrenicectomy in Pulmonary Tuberculosis

M TAPIA (*Rev Espan. de Tuberculosis*, April, 1930, p 25) records 11 cases of phrenicectomy in pulmonary tuberculosis, in patients aged from 17 to 52, and comes to the following conclusions Although in some cases lesions of the base of the lung improve after phrenicectomy this localization cannot be regarded as an ideal indication for the operation Resection of the phrenic nerve is specially indicated in cases of lesions of the upper part of the lung with a tendency to retraction Cases of early infiltration which prove refractory to a rest cure are also suitable for this operation The presence of plural effusions, especially if they are due to an effusion connected with artificial pneumothorax interferes with, or at least diminishes the efficacy of phrenicectomy Phrenicectomy is indicated particularly in those cases in which the patient s social position prevents his undergoing sanatorium treatment The operation is of no value as a test of functional capacity of the other lung.

77 Post-operative Thrombosis and Embolism.

E PAYR (*Zentralbl. f Chir* April 19th, 1930 p 961) states that during the last ten years there has been a very considerable increase in the number of cases of thrombosis, and particularly of severe and fatal pulmonary embolism, amounting in some clinics to 13.5 per cent. of all the fatal cases following operation In Payr's surgical clinic at Leipzig cases of pulmonary embolism formed 5 9 per cent. of the post operative fatalities in 1929, as compared with rates ranging from 0.5 to 3.5 per cent. in the previous nine years Operations on the head, neck, upper limbs and thorax were much less frequently followed by thrombosis

than operations below the diaphragm, the relation being 14 to 86 per cent Childhood is immune, and before the age of 20 thrombosis is very uncommon The average age for death from embolism is between 52 and 55. Early diagnosis is important, and is established by pain on pressure on the soles of the feet due to commencing stasis in the plantar venous network, and by the appearance of piles after operation Prophylaxis consists in exercise of the lower limbs in bed, respiratory gymnastics as soon after the operation as possible, and ligature of the saphenous or femoral veins on the occurrence of slight embolism

78 Surgery of the Prostate Gland

O S LOWSLEY (*Amer Journ of Surg*, March, 1930, p 526), in a review of 373 cases of operation on the prostate gland, states that the most important factor in the successful treatment of prostatic disease is the institution of suitable drainage until the patient reaches his maximum of renal efficiency The most satisfactory method of drainage is by means of a suprapubic double tube suction, the preliminary operation to be conducted under local anaesthesia The type of operation for the second stage can be decided by cystoscopy, or by digital examination, at the preliminary suprapubic cystotomy Whenever possible the hypertrophied gland should not be removed by the suprapubic route, but through the perineum, since the shock following the latter method is not so severe Sacral or parasacral anaesthesia is the most suitable kind for prostatectomy, in 95 per cent of the cases under review perfect anaesthesia was obtained, while the remaining 5 per cent only required slight reinforcement The procedure which proved the most satisfactory was a modification of Young's perineal operation There were 297 cases of adenomatous hypertrophy of the prostate gland, with a mortality of 5 7 per cent, 33 cases of carcinoma of the prostate, with a 10 per cent mortality, 40 cases of prostatic abscess, 2 cases of tuberculosis of the prostate gland, and one of Hodgkin's disease of the prostate There were no deaths in the last three types of disease

79 Solitary Adenoma of the Liver with Twisted Pedicle

PETIT DUTAILLIS and J LONGUET (*Bull et Mém Soc Nat de Chir*, April, 1930, p 506) report a case of adenoma of the liver with an unusual length of the pedicle, which was twisted A woman, aged 27, was admitted to hospital with a painful tumour in the right hypochondrium which had been noticeable since a labour three years previously, but had been treated as a floating kidney, after a subsequent pregnancy a sudden violent pain was felt in the epigastrium, referred to the back, and accompanied by repeated and profuse vomiting These attacks had occurred at frequent intervals for about a year, and during one which was extremely severe the patient was sent to hospital Urological examination showed that the diagnosis of floating kidney was incorrect, and operation was decided upon Laparotomy disclosed a round dark coloured tumour about the size of a cocoa nut, this was joined to the liver by a pedicle as thick as a thumb and about 3 cm long, which was twisted one and a half times The tumour was removed, there being no sign of cirrhosis of the liver, which was normal in every respect The wound was closed without drainage, and the patient made a good recovery The authors think it may be assumed that the torsion occurred during the involution of the uterus after pregnancy, a histological examination of the tumour showed that it was benign in character

Therapeutics.

83 The Value of Lemon Juice Milk

L H BARENBERG, H ABRAMSON, and W H MESSER (*Amer Journ Dis Child*, May, 1930, p 948) have been influenced by the work of Hess and Matzner, who added various juices containing natural organic acids in order to render milk sufficiently acid to counteract its buffer constituents, and at the same time to provide a sufficient quantity of anti scorbutic vitamin The authors favour lemon juice, with it the *p*H can be readily brought down to 5 3 or less, and the addition of the citric acid effects a curd in cow's milk comparable to the fine curd of woman's milk The standard formula as recommended by Hess is as follows milk 24 oz, water 12 oz sucrose 1/2 oz, lemon juice 21 c cm The *p*H of this mixture is about 5 3 When diluted milk is used the lemon juice is added to the water or other diluent, which is mixed slowly with the requisite amount of milk If whole milk is employed however, the fruit juice is added drop by drop the solution being stirred after each drop to avoid curdling Lemon juice milk cannot be distinguished macroscopically from ordinary milk mixtures, except for the presence of minute flocculi The lemon imparts to the milk a delicate, pleasant flavour, its acidity is barely detectable Egg yolk may be combined with lemon juice milk, providing the antirachitic factor as well as an additional amount of vitamin A and iron The authors treated 145 infants in three age groups—namely, those less than 3 months old, those aged from 3 to 6 months, and those from 6 to 12 months—who received lemon juice milk for periods of from six to twelve months, over a total period of five years In general the recipients of this milk manifested a better rate of growth than those who were given other milk preparations Further, there were fewer cases of diarrhoea among the lemon juice milk group, and these cases were milder The same protective influence against diarrhoea was noted in a smaller group of 25 children aged 1 to 2 years Lemon juice milk was also found of value as a food for children suffering from pneumonia and other respiratory ailments

81 Thyroid Therapy in Nephrosis

IT is now generally considered that nephrosis is not primarily a kidney disease Many authorities have contended that the condition is due either to a chronic staphylococcal infection in the nasal sinuses or to some other upper respiratory infection, and that the condition is controlled by appropriate treatment of the sinus disease or infection S J MCCLENDON (*Journ Amer Med Assoc*, April 19th, 1930, p 1202) reports three cases in which adequate treatment of the infectious processes had no effect on the oedema and albuminuria which characterize the disease, even though therapeutic measures were continued for long periods, whereas administration of thyroid extract produced a marked and immediate response This apparently confirms Epstein's theory that nephrosis is due to a metabolic disturbance rather than to a nasal sinus or other respiratory infection None of these cases conformed clinically to cases of myxoedema, since there was no mental retardation and there were no hair or skin changes Epstein has expressed the difference between myxoedema and nephrosis by stating that the distinction might be clarified by designating myxoedema as an actual hypothyroidism and chronic nephrosis as a relative hypothyroidism He does not believe that there are pathological changes in the thyroid gland, but that its activity, whether normal or increased, is insufficient to cope with the existing metabolic disturbance McClendon maintains that in order to obtain good therapeutic results thyroid extract must be given in adequate amounts Dietetic therapy and the treatment of the existing sinus conditions or other upper respiratory infection are important and necessary adjuncts in the treatment of nephrosis, but are not sufficient in themselves to control the oedema and albuminuria

82 Serum Treatment of Erysipelas

H VINCENT (*Gaz des Hop*, April 16th 1930, p 577) records his observations on cases of malignant erysipelas in adults which were characterized by a large amount of albumin in the urine, delirium, and hyperpyrexia The patients were treated by an antimicrobial and antitoxic antistreptococcal serum, large doses ranging from 60 to 100 c cm were given daily by intravenous injections The usual precautions were taken to prevent anaphylaxis, patients who had previously had any other horse serum were desensitized with an injection of 1 c cm some hours before giving the full dose As soon as the temperature became normal in very severe forms with renal or other complications the injections were continued subcutaneously in doses of 20 to 40 c cm for two days in order to prevent a relapse of the streptococcal infection.

83 R C ELLY (*Amer Journ Dis Child*, March, 1930, p 523) reviews the literature, and records his observations on 33 cases of erysipelas in infants aged from 3 weeks to 20 months treated by antistreptococcus erysipelas serum In the average case 10 c cm of concentrated serum was injected intramuscularly on admission and every subsequent day as long as the lesion persisted In desperate cases the initial dose was given intravenously and the rest intramuscularly In a few cases only two or three injections were needed, but usually six to eight were given before the infection completely subsided Of the 33 infants, 21 recovered and 12 died, but only 3 of the deaths occurred among the 19 who were treated within seventy two hours of the onset The most noteworthy and constant effect was disappearance of the toxicity with improvement in the general condition The disease recurred in two patients, both of whom made good recoveries after a second course of antitoxin A serum rash developed in 12 patients, the average day of appearance being the seventh

Dermatology.

84 Tuberculosis of the Skin following Measles

J ROBERT (*These de Paris*, 1930, No 66), who records thirteen illustrative cases in patients aged from 4 to 37, states that measles may be followed by various forms of cutaneous tuberculosis in the production of which this acute exanthem plays an important part The forms most frequently encountered are lupus vulgaris and verrucose tuberculosis The rarer forms are lichen scrofulosorum tuberculous gummata, and papulo-necrotic tuberculides Lupus vulgaris and verrucose tuberculosis present certain special features consisting in multiple disseminated patches affecting not only the face but the rest of the body and the extremities especially The lesions appear simultaneously like an acute exanthem, and attain their complete development immediately or very rapidly There is no fundamental difference between the two clinical types as is shown by transformation of lupus into verrucose tuberculosis and vice versa Lichen scrofulosorum, tuberculous gummata, and papulo necrotic tuberculides do not present any special features The cutaneous tuberculosis has a relatively favourable prognosis, and no tendency to ulceration or deformity has been noted But since the patient is a tuberculous subject he is liable to develop serious visceral disease, and therefore the outlook should be guarded The temporary anergy shown by disappearance of the cutl reaction in measles explains the development of tuberculosis following measles, and especially of cutaneous tuberculosis The inflammatory condition of the skin during measles is probably a predisposing cause of the cutaneous localization of tubercle bacilli

85 Bullous Erythema Multiforme.

L HUFNAGEL (*Bull Soc Franc de Derm et de Syph*, March 1930, p 358) reports the case of a patient who had suffered from recurring attacks of bullous erythema multiforme (hydroa of Bazin) for about ten years The onset of the dermatitis occurred in 1913, following a wound of the lip while eating shellfish, and was marked by an eruption of large bullae in the mouth, and of red papules over the hypogastric region, the penis, and limbs These attacks recurred regularly twice a year in the winter and summer, and lasted about fifteen days When the patient was seen in 1923 large bullae were noted on both lips the inner surfaces of the cheeks and the tongue Some of these were hard and violet coloured while others were less marked and of a greyish red colour Round red papules were found on both arms these were vivid and infiltrated at the periphery and paler in the centre, giving the very characteristic cockade appearance Fever was not present, but the malady caused difficulty in eating, and great mental distress over the facial disfigurement. A course of autohaemotherapy (ten injections) was given Though this did not shorten the duration of the attack, which lasted the usual fifteen days it has evidently established a cure, since there has been no recurrence since it was administered seven years ago

86. Cutaneous Neuroma.

J B LUDY (*Arch Derm and Syph*, March, 1930, p 419) reports a case of cutaneous neuroma occurring in a coloured tuberculous woman, aged 37, who had suffered from prolonged and distressing "colds" when a girl Four years prior to admission to hospital there appeared on each extremity from fifteen to twenty deeply pigmented, discrete, firm, flattened tubercles varying in size from a split pea to a hazel nut, and some showing umbilication they were firmly incorporated in the skin and diffusely distributed, not following the line of any nerve trunk. Symptomless at first they eventually gave rise to bouts of severe itching and tenderness. The Pirquet test was positive and the Wassermann reaction negative, an *x* ray examination revealed an old inflammatory condition at the left apex and dense opaque shadows of the lower part of the right lung suggesting thickened pleura with fluid. Under injections of old tuberculin at irregular intervals the chest signs improved and no fresh skin lesions appeared for two months, the attacks of pain were less severe and not so frequent Microscopically numerous ill defined strands of medullated nerve trunks, extending in all directions through the subpapillary parts of the corium, were seen Ludy remarks that in such cases the essential pathological process is located in the corium and consists of a meshwork of medullated and non medullated nerve fibres possibly representing the disintegration of some parent nerve trunk. He adds that a distinction should be drawn between tumours originating from the endoneurium and nodules (such as tuberculides) depending on toxic stimuli producing focal granulomatous reactions In lesions with pain of a paroxysmal type careful search should be made for nerve fibres

Obstetrics and Gynaecology.

87 Appendicitis in Pregnancy

B B LANDRY (*New England Journ of Med*, April 10th 1930, p 722) remarks that the points diagnostic of appendicitis are similar in pregnancy and in the non pregnant state, with two exceptions (1) more reliance should be placed on localized pain, nausea and vomiting being often absent, or, when present, due to toxaemia or nephritis, and (2) leucocytosis, unless very definite, has little significance, since 13,000 cells per cubic millimetre may be found frequently in pregnancy A rising leucocyte count, or a change in the differential cell values, are very important Emphasis is laid on the important diagnostic point that the majority of pregnant patients who develop acute or chronic appendicitis have had previous attacks The danger and difficulty of the operation in pregnancy, and the risk of a chronic appendicitis becoming acute and terminating in perforation (especially after the fourth month, when the omentum and small intestine have been pushed upwards by the enlarged uterus) render it most advisable that a woman who has a definitely diseased appendix should have it removed, either before marriage or during the very early months of pregnancy During the first six months of pregnancy the treatment of appendicitis is on ordinary lines, but very careful abdominal manipulation is essential, and, whenever possible, drains should not be employed lest weakening of the abdominal wall should result. After the sixth month an accessible appendix should be removed, regardless of the possibility of subsequent abortion In the later months of pregnancy diffuse peritonitis is a very probable sequel of acute appendicitis, the omentum and small intestine having been pushed aside During the last two months of pregnancy the problem of concurrent appendicitis is most serious perforation and general peritonitis may occur rapidly, and appendicectomy alone will precipitate labour Landry advocates abdominal Caesarean section in these cases

88 Prophylaxis against Obstetrical Difficulties.

M RIVIÈRE (*Gaz Hebd Sci Med de Bordeaux*, May 18th, 1930 p 305) emphasizes the importance of pelvic changes in infancy being observed and prevented from persisting, since in later life they give rise to difficulties in the course of labour The infantile pelvis may be seriously affected by rickets particularly if this disease occurs soon after birth, tuberculosis and infantile paralysis have also to be considered in this respect Rivière urges orthopaedic surgeons to bear these effects in mind, in order that commencing rickets may be arrested before it has time to cause deformity of the pelvis The condition should be diagnosed before attempts at walking are made and chemotherapy may be desirable in order that calcification may progress In later cases of rickets it is necessary to remember that the degree of severity of the condition is not to be estimated alone by the extent of deformities of the lower limbs Immobility of the body must be secured as soon as the diagnosis is made, and the pelvis must be protected against any stresses which would lead to alterations in its shape and dimensions Similarly, with spinal tuberculosis early immobilization is required, and the liability of the pelvis to indirect morbid change has to be borne in mind The author concludes that closer co-operation between orthopaedic surgeons and obstetricians is urgently desirable, in view of the fact that many difficulties in subsequent labour can be obviated by early attention being paid to the sensitivity of the female pelvis to certain general diseases

89 Ovarian Haemorrhage.

H STUCKERT (*Journ Amer Med Assoc*, April 19th 1930 p 1227) recalls the fact that haemorrhage from the ovary is most difficult to diagnose clinically, and that the true source of the bleeding may only be recognized during an operation. The condition is usually seen in young women about the time of the menstrual period, and the bleeding often appears as an exaggerated normal discharge Two types of ovarian haemorrhage may be distinguished in one the bleeding is primary and in the other secondary to rupture of a haematoma The etiology of the primary form is defined by Wilson as follows As menstruation approaches there is an increased flow of blood to the pelvic organs this results in intra-ovarian tension and forces the maturing follicle to the periphery of the gland When the ovum is discharged, haemorrhage takes place into the follicular cavity Normally, a rounded clot is formed, but occasionally this does not occur, and the patient early shows signs of internal haemorrhage and shock. Phaneuf recognizes four groups of haematoma of the ovary large ovarian cysts with haemorrhagic contents, due to torsion of the pedicle, haemorrhagic cysts of the Sampson type (chocolate cysts), haematomas of the Graafian

follicles, and haemorrhagic cysts of the corpus luteum Rupture of any of these types may give rise to severe intraperitoneal haemorrhage The probable causes of these haemorrhages are predisposing and local or exciting The former are general rather than local, and include typhoid and scarlet fever, general disorders of the heart and liver and of nutrition (anaemia, chlorosis, haemophilia), phosphorus poisoning, influenza, and rheumatism The local and exciting causes are passive hyperaemia, thrombosis, torsion, chronic oöphoritis, tumours of the small pelvis, uterine retroflexion, inflammatory processes, sudden checking of the normal circulation, and trauma Stuckert agrees with Ravdin that it is best to operate in all cases of this type, even when the symptoms are mild, since a definite diagnosis cannot be made without laparotomy nor the possibility of continued bleeding be estimated

90 A Full-term Ectopic Gestation

A H SINGLETON (*Canadian Med Assoc Journ*, May, 1930 p 679) refers to the case reported by Mabel Ramsay in the *British Medical Journal* of November 23rd, 1929 (p 954), and records details of another case in which ectopic gestation proceeded to full term In a multipara a large tumour developed in the abdomen, but the cervix showed none of the signs of pregnancy, and a sound proved the uterus to be empty. An ovarian cyst was diagnosed and an operation was therefore performed The tumour was found to be adherent to the abdominal wall and to all the surrounding structures except the kidneys, spleen, and liver The adhesions were separated with difficulty, and the tumour was entirely enucleated On opening it a full term foetus was found, it was completely developed, not macerated, and apparently normal except for the exaggeration of the ordinary flexures from the pressure of the tight cyst wall Both the placenta and cord were very macerated, however The patient made a good recovery

Pathology.

91 Diagnostic Value of Casoni's Reaction

L MORINAS and P LAGEZE (*Journ Méd de Lyon*, April 5th, 1930, p 217) have employed Casoni's intradermal injection of hydatid fluid in many cases in their hospital practice, of these, twelve proved to be cases of hydatid cyst The method is more simple, rapid, and reliable than all the serum reactions used hitherto It must be recognized, however, that (1) although simple, it may be occasionally of doubtful interpretation, (2) it is most often negative in cases of dead or suppurating hydatid cysts, and (3) it is constantly positive in patients suffering from taeniasis—a recent discovery, but, as a cause of error, easily eliminated The paucity of pathognomonic signs of hydatid cysts has led the authors to seek in the laboratory a specific test of human hydatid disease Many methods have been suggested, the complement fixation test is positive in 70 per cent only of cases of hydatid cyst (according to the majority of statistics), but numerous observers have found it positive when echinococcosis is absent Many of these errors are due to faulty technique Other proposed tests are a hydatid precipitin reaction and a passive anaphylactic reaction, these are sometimes employed Casoni's test has been used extensively since the war in many European countries, Africa, and South America Hydatid fluid of human origin, or preferably from a sheep, which is easier to obtain, is filtered a small syringe and a very fine hypodermic needle are employed The skin of the thigh or of the forearm is sterilized by applying a tampon saturated in ether, without friction, lest erythema should occur and render the result doubtful, 0·2 to 0·5 c.cm of the filtered hydatid fluid is injected obliquely into the skin This causes a white papule of the size of a lentil to appear, which either increases or is absorbed, as the reaction proves to be positive or negative The injection should be given intradermally, if the point of the needle pierces the whole thickness of the skin the fluid will be diffused in the areolar tissue It is advisable to make a control injection with physiological saline solution, at a short distance from the first, a weak solution of albumin, such as dilute peptone broth, has been recommended for this control injection, but the present authors consider this unnecessary If the papules disappear with slight subcutaneous swelling, whether or not accompanied by a zone of erythema, the reaction is negative When positive, while the control papule disappears, that produced by the hydatid fluid increases progressively, and is surrounded by a sharply defined whitish urticarial plaque as large as a sixpence, the colour becomes livid on compression, and the patch is surrounded by an erythematous and slightly oedematous zone This reaction occurs generally about fifteen minutes after injection The urticaria may persist for two hours

92 The Upper Respiratory Flora of Infants

L KAFFLAND (*Journ Exper Med*, April, 1930, p 617) has made an examination of the bacterial flora of the nose and throat in normal infants and in those suffering from colds The nasal cultures were taken by inserting a swab into the anterior nares, and passing it as far back as possible, the throat swabs were rubbed over the visible portion of the oropharynx The swabs were streaked on 5 per cent rabbit blood agar plates, which were incubated aerobically The upper respiratory tract at birth was found to be sterile Bacteria appeared in the throat after the first feeding, the commonest organism being a haemolytic and non haemolytic streptococci and *Staphylococcus albus* Successive cultures during the first two weeks of life revealed in the throat a copious flora, which differed from that of the adult only in the absence of pathogenic organisms—pneumococci, β haemolytic streptococci, and Pfeiffer's bacillus By eight months the oropharyngeal flora was entirely comparable with that of the adult, the potential pathogens, with the exception of the pneumococcus, had appeared, often without causing any disturbance As regards the nasal flora, cultures were generally sterile for the first day or two of life Organisms then appeared, though not abundantly, *Staphylococcus albus* being generally predominant, next in frequency came diphtheroid bacilli and unidentified large Gram positive cocci During the first two weeks of life pneumococci, β haemolytic streptococci, and Pfeiffer's bacillus were completely absent, and Gram negative cocci were found on only one occasion At eight months the nasal flora was comparable with that of the adult, though it is noteworthy that β haemolytic streptococci were uniformly absent Two groups of infants with colds were studied The first group comprised 21 infants examined during their first cold, no marked difference in the respiratory flora was found from that of the normal group of infants The second group was composed of 14 infants who had a history of recurrent colds, which were more severe than the colds in the first group Their throat flora was similar to that of the normal group, except for the presence of pneumococci in two infants On the other hand, their nasal flora was notably different thus pneumococci were present in 43 per cent, as against the normal 14 per cent, and Pfeiffer's bacillus was found in 21 per cent, as against the normal 7 per cent The author concludes that there is no specific bacterial cause for the first cold of infancy, but that in infants with recurrent colds secondary infection of the nose with pneumococci or Pfeiffer's bacillus probably plays a part

93 Experimental Epidemiology of Tuberculosis

M B LURIE (*Journ Exper Med*, May, 1930, p 743) exposed a number of guinea pigs to the risk of infection in an animal house which contained a variable number of tuberculous animals The guinea pigs were distributed more or less evenly about the room Of 103 guinea pigs exposed for a period of three weeks to thirty two months 15 developed tuberculosis, the shortest period of exposure leading to fatal tuberculosis was eight months Eleven of the 15 animals died from tuberculosis, the remaining 4 died from some complicating condition The average survival time of the 11 animals which died from tuberculosis was 551 days The disease was generally of a chronic type, and was characterized by massive tuberculosis of the lungs often with cavity formation The tracheo bronchial glands were enlarged and fibro caseous, the mesenteric and cervical glands were affected only slightly, if at all Tuberculosis in the liver and spleen was usually only moderate in extent, and was often retrogressive It appeared that the infection had entered by the respiratory tract It is concluded from these results that spontaneous tuberculosis may occur in guinea pigs exposed for a sufficient length of time to an adequate degree of infection

94 The Reid Hunt Reaction in Bronchial Asthma

WHITE mice fed with the blood of patients suffering from Graves's disease show an increased resistance against poisoning with acetonitril, the same increased resistance is found when the mice are given thyroid gland, and it has been named after Reid Hunt, who described it first In a series of investigations C OEHME and H PAAL (*Med Klinik*, March 28th, 1930, p 454) found this reaction positive in 100 per cent of cases of Graves's disease (30 cases) and in 12 out of 17 cases of bronchial asthma The reaction was weakened by pilocarpine administration in cases of asthma, but was not influenced by this drug in cases of Graves's disease The authors therefore conclude that hyperthyrosis and asthma are intimately related, probably through the sympathetic nervous system

de KUYPER'S
HOLLANDS

Distilled from genuine malt liquor with the Juniper berry added The advantage gained by distilling the berry with the spirit is the production of a preparation of Oleum Juniperi, mellow and free from irritating properties

Oleum Juniperi is official in the British Pharmacopœia, and is described as carminative, anti-spasmodic, and a stimulating diuretic

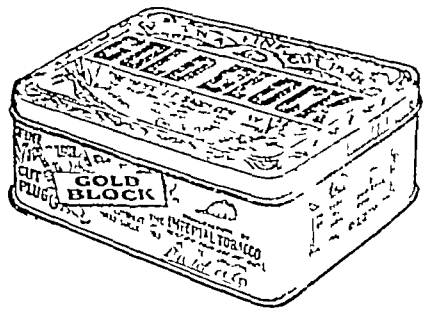
In this form, therefore, the oil of Juniper can be safely taken with regularity

Distilled by the same family for 233 years

STANDARDISED VITAMIN

DAVITAMON D
(vitamin D "Organon")
ANTI-RACHITIC

DAVITAMON AD
(vitamins A&D "Organon")
ANTI-INFECTIOUS & ANTI-RACHITIC



Vitamin D now being standardised, these preparations contain 10,000 antirachitic units per c c oily solution

Manufactured by THE ORGANON LABORATORIES, Oss (Holland)

LONDON HOSPITAL MEDICAL COLLEGE & DENTAL SCHOOL.

THE WINTER SESSION will Open on Wednesday, October 1st.

The Hospital is the largest in England. There are 839 beds in constant use. Last year number of in-patients 13,992, new out-patients 89,972, attendances 566,595, new dental patients 5,622, major operations 7,422.

The Medical College and Dental School are essentially modern with large laboratories equipped with the latest and the most approved appliances. The STAFF is so large as to permit of individual attention being paid to all Students.

Medical Unit.—A Clinical Unit in Medicine, under the charge of a whole-time Director, provides for the more elaborate methods of diagnosis and treatment and takes a leading part in the initiation and co-ordination of medical research.

Research Funds: the value of over £115,000 permits of financial assistance being given to Students and Graduates engaged in Medical Research.

Scholarships and Prizes to the value of £1,158 are awarded annually, including four Open Entrance Scholarships to the value of £350 and two Entrance Scholarships open to Students of the Universities of Oxford and Cambridge to the value of £200.

Appointments.—Over 160 Appointments are made annually from Students of the College recently qualified.

Special Courses are held for all the University Examinations, for the Primary and Final Fellowship Examinations of the Royal College of Surgeons, and for the Membership Examinations of the Royal Colleges of Physicians.

Hospital Practice.—Exceptional opportunities are offered to qualified Practitioners wishing to attend the General Practice or the Practice of a Special Department of the Hospital.

A Club Union and Tennis Ground of over 15 acres and a *Students' Hostel* promote the recreation, health and comfort of the Students.

For Prospectus and Particulars apply to the Dean (Professor WILLIAM WRIGHT, M.B., B.S., F.R.C.S.), who will be pleased to make arrangements for anyone wishing to see the Medical College and Dental School.

MILE END, E.

INDIAN MEDICAL SERVICE

Recruitment of European Officers.

Applications are invited from medical men for permanent commissions in H.M.'s Indian Medical Service. The terms offered include a gratuity of £1,000 on retirement after six years' service, or £2,500 after 12 years' service, together with free return passages, for those who no longer desire to remain in the Service In other respects the terms will be as detailed below

Candidates must be British subjects under 32 years of age at the time of application and must be registered under the Medical Acts in force in Great Britain and Northern Ireland

CAREERS

The Indian Medical Service offers wide opportunities of medical experience including clinical preventive specialist and research work At the beginning of his career an officer is employed on the military side which has medical charge of the Indian Army Promotion is on a time scale up to the rank of Lieutenant-Colonel and by selection to the ranks of Colonel and Major General An officer may apply after two years Indian service to have his name registered for transfer to the civil side from which appointments are made to Civil Surgeoncies which are established at the principal civil centres to provide for the medical needs of civil officials and for general medical administrative purposes to specialist (for example public health and bacteriological) services to research posts and to professorships at the Medical Schools

PAY

The monthly rates of pay for European officers in the Service who have a non Asiatic domicile are as follows

Rank	Service in Rank	Basic Pay	Overseas Pay	Year of Total Service
1	2	3	4	5
		Rs	Rs	
			100	1st
Lieut.	—	500	100	2nd
			100	3rd
Capt.	(i) During first 3 years service as Captain	650	£10	4th
			£15	5th
	(ii) With more than 3 and less than 6 yrs service as Captain	750	£	6th
			£	7th
			£	8th
	(iii) With more than 6 years service as Captain	850	£	9th
			£	10th
			£	11th
			£30	12th
Major	(i) During first 3 years service as Major	950		
	(ii) With more than 3 and less than 6 years' service as Major	1100		
	(iii) With more than 6 years service as Major	1250		
Lieut.-Col.	(i) Until completion of 23 years total service	1,000	£30	13th and over
	(ii) During 24th and 25th years' service	1600		
	(iii) After completion of 25 years' total service	1,100		
	(iv) When selected for increased pay	1850		

EXTRAS.—In addition to the above rates various allowances are admissible for a large number of special appointments on both the military and the civil side which may be held by members of the Indian Medical Service Special high rates of pay are also attached to the numerous administrative appointments open to officers in both branches of the Service

ANTEDATES IN COMMISSION

Any service rendered by an officer during the war as a medical or combatant officer, or in a position usually filled by an officer, may be counted as service for increments of pay, promotion, retirement and retired pay but not for gratuity

One half of any service in the ranks during the war may be counted as service for retirement and retired pay only

Candidates possessing certain higher medical qualifications may be granted an antedate of one year in their commissions Past service in certain hospital appointments may also render candidates eligible for an antedate of one year Persons holding or about to hold resident posts at recognized hospitals may be seconded in those posts for a period not exceeding one year The maximum period of antedate secondment or antedate and secondment combined admissible under this paragraph, is limited to one year

OUTFIT ALLOWANCE

Officers on appointment will receive an outfit allowance of £50

PRIVATE PRACTICE.

With the exception of Administrative Officers military or civil and officers holding certain special appointments officers are not debarred from taking private practice so long as it does not interfere with their proper duties

PENSIONS

The rates of pension are as follows	Per annum
	£
After 17 years service for pension	400
,, 18 ,,	430
,, 19 ,,	460
,, 20 ,,	500
,, 21 ,,	540
,, 22 ,,	580
,, 23 ,,	620
,, 24 ,,	660
,, 25 ,,	700
,, 26 ,,	750
,, 27 ,,	800

These rates are subject to alteration on account of a rise or fall in the cost of living as compared with the year 1919 to an extent not exceeding 20 per cent in all the revision being undertaken triennially With effect from July 1st 1927 a reduction of 4½ per cent has been made on this account from the amounts shown

There are additional pensions ranging from £65 to £350 per annum for officers who have held administrative appointments

PASSAGES

An officer on appointment is provided with a free passage to India The wives and families of officers who are married prior to the date of the officers embarkation on first appointment will also be provided with free passage to India subject to the payment of messing charges

Officers and their families are also eligible for passage concessions under which they are granted a certain number of return passages home at Government expense during their service

INSTRUCTION PRIOR TO EMBARKATION

Officers are required to undergo courses of instruction at the Royal Army Medical College and at Aldershot lasting approximately six months prior to their embarkation for India on first appointment.

Full details regarding these appointments and forms of application may be obtained from the Under-Secretary of State for India, Military Department, India Office, London S W 1 The Selection Committee will meet at the India Office in August, and the selected candidates will be required to join a course of instruction commencing early in August, 1930 Applications should be submitted as soon as possible

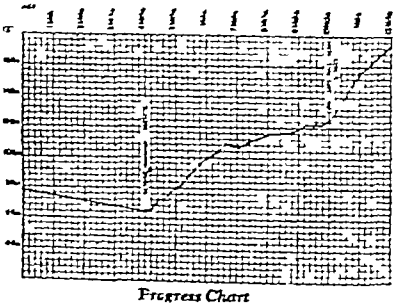
NATURALLY RICH

IN VITAMIN "D"

A "RESURRECTION"

GUILDFORD
30 6'30



"Baby Hook, came under my care shortly after birth suffering with marasmus following whooping cough Broncho-pneumonia developed and was with great difficulty cleared up, leaving the child in a very low condition Feeding proved a difficult problem, several things were tried without beneficial results. The results with Cow & Gate were truly wonderful, indeed it is a case of 'a resurrection.'"

(Signed)..... M.B Ch B.

Lacidac (separated) and Brestol, the Cow & Gate Humanised Cream, were used in the early days of treatment. Cow & Gate Full Cream and Brestol being used subsequently.

BEFORE—4 months' old, 6 lbs. 9 ozs. in weight.

Progress Chart

AFTER—10 months' old, 12 lbs. 6 ozs. in weight.

June 1930 Baby Hook has now won a prize in a Baby Competition!

THE POSTAL ACCOUNT

It is often supposed that to live a long way from the nearest branch of a bank, or to be constantly unable to go to the bank in person, is a handicap to the enjoyment of the full advantages which, it is admitted, a banking account offers Perhaps it is assumed that to conduct an account by post involves 'more letter writing', or is costly or is not welcomed by the Bank It is the aim of the Westminster Bank to dispel such misconceptions by a leaflet entitled *The Postal Account*, which explains the convenience of the method, and offers some clear suggestions

The Secretary of the Bank will be pleased to send a copy on application

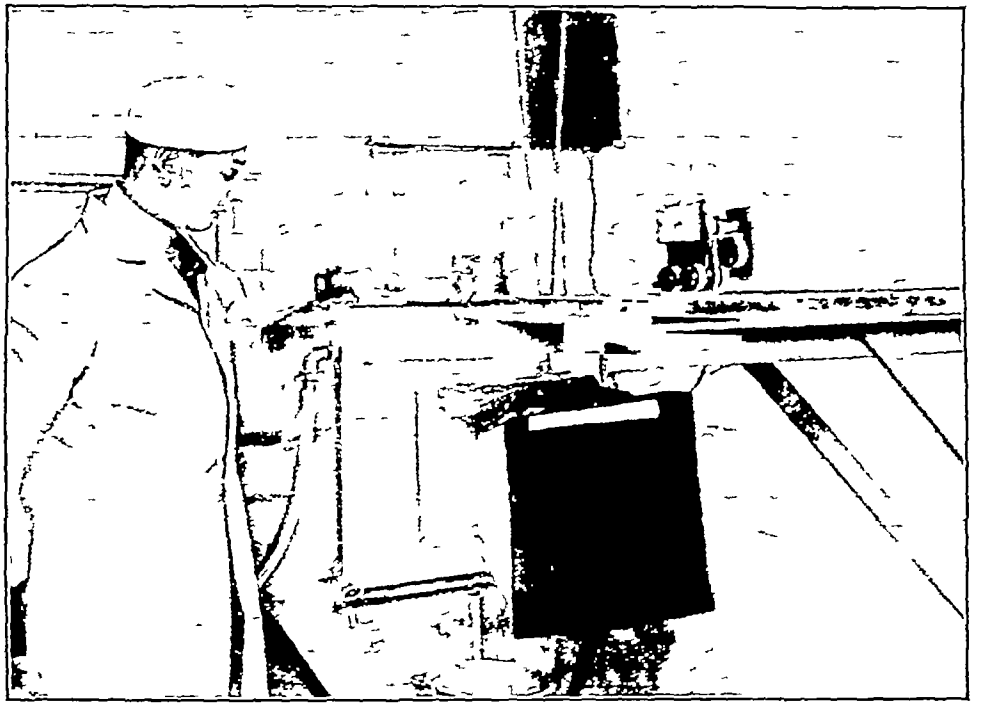
TUBERCULOSIS...
"A disease of houses"

Tuberculosis has been well described as "a disease of houses" Although we cannot hope to cure individual cases of tuberculosis by making our houses healthier we can do much to *prevent* this dread disease by admitting fresh air and "whole" daylight into every kind of building where people live and work indoors

"Vita" Glass offers the simplest and most practicable means of bringing the ultra-violet rays to indoor workers Its permanence is guaranteed and the new stabilised prices, from 1/- per square foot, make its cost reasonable whether recommended by the general practitioner for private patients or by the medical officer for buildings under his control

Write for further particulars to the "Vita" Glass Marketing Board, 9 Crown Works, St Helens, Lancashire



"Vita" Glass is obtainable from local Glass Merchants, Plumbers, Glaziers and Builders

"VITA" GLASS

"Vita" is the registered Trade Mark of Pilkington Brothers Limited, St. Helens

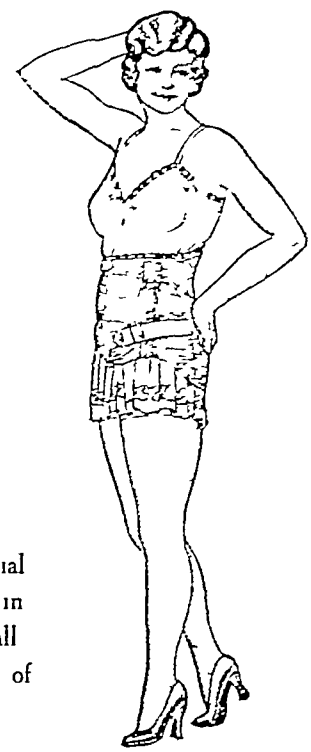
Salt and Son Ltd

SALT'S MATERNITY BELT-CORSET

From our own experience (and confirmed by the opinion of many Medical Men) we are convinced that this Corset is vastly superior to anything previously made, for the following reasons

1 It has an elastic front with lacing at each side which allows the necessary expansion.



2 It has a deep back, closed and firmly boned which gives great support.

3 It is not carried above waist in front, thus avoiding pressure on bust.

4 It has a lower abdominal support which provides maximum uplift.

5 It gives great comfort to the wearer by reason of its simplicity and elasticity

6 It is anatomically correct throughout.

As in the case with all Salt's Special Appliances, this Corset is supplied in varying qualities to suit the means of all and is made **only** to the requirements of each individual case

Catalogues sent on request.

Alimentary Toxæmia and Endocrine Insufficiency

A WRITER in *The Lancet* directed attention to an apparent connection between Alimentary Toxæmia and endocrine insufficiency, particularly of the thyroid gland Many cases of 'ill-health," neurasthenia and others, were benefited by the administration of thyroid extract

Intestinal Disinfection

He goes on to remark that there seems to be a close connection between endocrine insufficiency and poisoning from intestinal absorption, and notes the beneficial results obtained by the use of intestinal antiseptics in addition in these cases

He seems to be unaware that the best of all intestinal antiseptics is Kerol In endocrine insufficiency, therefore, use Kerol in addition to other measures

For intestinal disinfection, use KEROL CAPSULES (keratin-coated), they contain 3 minims of Kerol One to three capsules may be given three or four times a day after meals

Kerol Capsules

Please send for Literature and Samples, which will be sent free to any member of the Medical Profession.

A Distinct Advance Over Preparations of Acetyl-Salicylic Acid

Acetyl salicylic acid possesses a notable disadvantage Physicians have proved that it cannot be tolerated by patients suffering with a delicate stomach Consequently, the value of this medicament in the wide field in which it is indicated is very seriously reduced

"Alasil" completely overcomes this objection By combining calcium acetyl-salicylate with "Alocol," unfavourable secondary action upon the stomach is prevented This beneficial influence is undoubtedly due to the presence of "Alocol" (Colloidal Hydroxide of Aluminium), which preparation has brilliantly stood the test of practice in the treatment of hyperacidity and other ill conditions of the gastric tract "Alasil" is therefore a triumph over acetyl-salicylic acid It enables higher doses to be administered and maintains the patient's system under its influence for a greater length of time Analgesic, Antipyretic and Sedative, "Alasil" is indicated in all cases where acetyl-salicylic acid has been used heretofore

A supply for clinical trial with full descriptive literature sent free on request

COLONIC LAVAGE

A SUGGESTED IMPROVEMENT in the PLOMBIERES TREATMENT

By

Capt J T AINSLIE-WALKER, R.A.M.C (T.F.), F.I.C., F.C.S

Extract from "The Medical Press," 7th November, 1923

It is generally known the Plombieres treatment in cases of colitis and other forms of intestinal disorders is now largely resorted to Its increasing vogue has been chiefly due to its results favourable up to a certain point but incomplete in a particular detail which militates against a curative effect The principle upon which the lavage method rests is to remove the bowel contents by means of irrigation at regular intervals Thus the whole process is a mechanical one and it leaves out of account the toxin producing bacteria of the intestines which still remain after the irrigation Captain Ainslie-Walker makes a valuable suggestion in his brochure by which this difficulty can readily be overcome In the course of his researches the fact has been established that an ordinary Plombieres solution after expulsion from the bowel shows confluent growth but under the same circumstances a Plombieres solution in which Dimol powder has been previously dissolved shows no growth The experiments are described by which the results are obtained By the simple method therefore of adding this intestinal bactericide—Dimol—to the Plombieres solutions the circle of effective treatment is made complete

Copies of this brochure will be sent, free of charge on application to the

KOLYNOS
DENTAL CREAM
(Made in England)

The properties desirable in a dentifrice have been specified as follows, viz

Antiseptic	Harmless to Mucous Membrane
Pleasant Flavour	Non-poisonous to the user
Mildly Alkaline	Must not alter reaction of the Saliva
Contains Chalk as an Abrasive	Must not destroy Salivary ferments
Contains Soap as an Emulsifier	Must not inhibit the secretion of the Saliva

Twenty years of varied and painstaking laboratory experiments with the wide and ever-increasing endorsement of the profession have demonstrated that these qualities are embodied in Kolynos Dental Cream

Write TO-DAY for free professional samples literature, etc

KOLYNOS DENTURE POWDER

An entirely new preparation for effectively cleaning artificial teeth Can be used on the most delicate dental plate with complete safety and satisfaction.
Antiseptic *Convenient in use*

FOOD POISONING—
THE KAYLENE TREATMENT

The following letter has been received

Messrs KAYLENE, LTD

DEAR SIRS,

I am in receipt of your sample of Kaylene, for which I thank you I do not dispense and do not wish to be without some in the house

My last sample was used on a patient suffering from acute Ptomaine poisoning following a meal of shell fish (mussel) at 10 30 p m Symptoms first appeared at 12 30 a m , and when I saw him at 3 0 a m he was vomiting blood and passing almost pure blood per rectum He had commenced cramps and nervous twitchings which would shortly have gone on to tonic convulsions He was very collapsed and had a weak pulse I gave him **only** Kaylene in cold water one drachm every quarter of an hour, from 3 0 until 8 a m , when I felt it safe to leave him For the next two days Kaylene was given every one to two hours, and was then followed by Kaylene-ol No other medication of any sort was used, and he made an excellent recovery This follows a somewhat similar case which I treated at the end of last year

Your excellent preparation should supplant Bismuth for any purpose

Yours faithfully,

Physician to ——— ———, M B

THE FRENCH NATURAL MINERAL WATER

VICHY-CÉLESTINS

And the other State Springs of Vichy
(Property of the FRENCH STATE)

INDICATIONS

GASTRIC

PRIMARY DYSPEPSIAS
- Hyperpepsia—Intermittent hyperchlorhydria
- Hypopepsia and apepsia—Dyspepsia arising from disturbance of neuro-motility
- Intermittent pyloric stenosis, not of organic origin

SECONDARY DYSPEPSIAS
- Arthritic dyspepsia
- Toxic dyspepsia (gastro-hepatic)
- Dyspepsia due to enteroptosis

HEPATIC

- Congestion due to excessive or improper feeding
- Congestion due to cirrhosis (before the cachectic stage)
- The diathetic congestions of diabetic, gouty, and obese persons
- Congestion due to poisoning (mercury, morphine etc.)
- Toxic congestion (influenza typhoid fever, etc.)
- Biliary lithiasis

MALARIA AND TROPICAL DISEASES

DIATHESIS

The diabetes of fat people — Arthritic obesity — Uricæmia and gout — Rheumatic gout

URINARY GRAVEL

CAUTION.—Each bottle from the STATE SPRINGS bears a neck label with the word "VICHY-ETAT" and the name of the SOLE AGENTS

INGRAM & ROYLE, LIMITED,

SANDOZ

SANDOZ

CALCIUM-SANDOZ

$(C_6H_{11}O_7)_2$ Ca

Unique Advantages:

1.—It is effective. It supplies the physiologically active calcium ion

2.—It shows distinct superiority in all modes of administration

ORALLY It is well absorbed It is easily administered and does not upset the digestive tract

INTRAVENOUSLY It is better tolerated than calcium chloride The acid-base factor is eliminated

INTRAMUSCULARLY It is painless and non-irritating It is the only calcium salt which can be so administered in adequate doses

3.—It enables physicians to adequately meet the requirements of any given case.

BY VEIN, for acute need
BY MUSCLE, to secure intense and prolonged action
BY MOUTH, for prolonged administration, to meet an increased demand by the organism

4.—It is completely sufficient in itself as a therapeutic agent.

CALCIUM-SANDOZ is supplied in

Ampoules containing a 10% sterile solution for intravenous or intramuscular injection

5 c c size Boxes of 2 and 10 ampoules
10 c c size Boxes of 1, 5, and 20 ampoules

Powder for oral administration—Cartons of 2, 4, and 16 ounces

Tablets for oral administration—Each tablet contains 25 grains of calcium gluconate and is especially adapted for division into three parts Boxes of 30 and 150 tablets Cartons containing 12 boxes of 30 tablets

A Paper on ACUTE PERFORATING DUODENAL AND GASTRIC ULCERS *

BY

JOHN H WATSON, MB BS FRCS,

SURGEON VICTORIA HOSPITAL BURNLEY

THE earliest account of a perforating gastric ulcer was presented to the Royal Society by Christopher Rawlinson in 1729, and the earliest description of a perforated duodenal ulcer was written by Jacopo Penada of Padua in 1783 Dr Samuel Gee in his Bradshaw Lecture for 1892 gave a translation from the French of a most graphic account written by Madame De La Fayette of the death agony of Henrietta, Duchess of Orleans, on June 26th 1670, at St Cloud It was thought by the English Royal House that this unfortunate Princess had been poisoned at the instigation of her husband but Littre in 1872 pointed out that the description of the Duchess's acute illness and the post-mortem findings were without doubt typical of a perforated gastric ulcer In the Bibliotheque Nationale there is preserved a Memoir of a Surgeon of the King of England who was present at the opening of the body of Madame" which contains these interesting comments

> On opening the abdomen fetid gas escaped the whole of the abdomen was full of a sanious putrid yellow watery fluid mixed with oil the outside of the stomach looked healthy and the inside was free from disease except for a little hole in the middle of the anterior wall which had been accidentally produced by the surgeon with the point of his scissors

Benjamin Travers (a former President of the Royal College of Surgeons) in 1816 described very accurately several cases, two of these which I take the liberty of quoting have very interesting post-mortem findings

Case 1—Mr —— aged 35 of a strumous habit but enjoying generally good health was seized whilst dining in company with an excruciating pain in the abdomen which he described as unlike any he had ever felt His abdomen was tense and hard his respiration somewhat agitated flatus rose in quantity from his stomach but he had no disposition to vomit and he died in a warm bath at 6 a m sixteen hours after the attack of pain Post mortem a large quantity of fluid tinged with bile was found contained in the pelvis and about a finger's breadth below the pylorus appeared a circular foramen having a peritoneal margin of the diameter of a writing pen It proved to be the centre of an irregular superficial ulcer of the mucous coat including in its extent two-thirds of the ring of the pylorus

Case 2—Mills a hairdresser had occasionally for the seven preceding years suffered sudden and very violent attacks of abdominal pain from which he had always been speedily relieved by a wine-glass full of brandy on the day of the fatal attack enduring severe pains On reaching home this pain became intolerable and he died 36 hours from the commencement of the intense pain Post mortem a circular aperture of the peritoneum large enough to admit a crow's quill was found at the junction of the duodenum and stomach

Travers sums up the principal signs of these perforating ulcers in a paper published in the *Medical and Chirurgical Transactions* of 1817, in the following striking way

> Sudden most acute and unremitting pain radiating from the scrobiculous cordis or the navel to the circumference of the trunk and even to the limbs its intensity absorbs the whole mind of the patient who within an hour from the enjoyment of perfect health expresses his serious and decided conviction that if the pain is not speedily alleviated he must die coeval with the attack of pain there is a remarkable rigidity and hardness of the belly from a fixed and spastic contraction of the abdominal muscle

Apart from Travers there was no contribution of any importance to the literature of perforating ulcers of the stomach in the early nineteenth century by any English surgeon, but several physicians including Matthew Baillie John Abercrombie, Sir George Baker, William Brinton and George Budd, wrote descriptive articles in which they described not only ulcers of the stomach but also ulcers of the duodenum Abercrombie in fact suggested a dietary which in many respects resembles the routine medical diet of to-day Brinton, who made a remarkable number of post mortem investigations and analysed some 1 200, makes the statement that of the less frequent ulcers on the anterior wall of the stomach as many as 85 per cent perforate, and most of them into the general peritoneal cavity

Until the close of the nineteenth century it was generally considered that a perforation of any gastric ulcer into the general peritoneal cavity meant certain death In the year 1888, however, Mikulicz attempted to close an acute perforation of the stomach by suture, but without success a successful case was reported by Heusner in 1892 At the British Medical Association Meeting at Bristol in 1894 Pearce Gould opened the discussion on the operative treatment of perforating gastric ulcers, and recorded the fact that he knew of only seven cases in which an operation had ended in success In this same year H P Deane of the London Hospital recorded a case in which he had successfully sutured a perforated duodenal ulcer and another was reported by L A Dunn in 1896 Since this time there has been an ever-increasing number of cases recorded each year, and there is a marked improvement in the results of operative treatment This is shown by the following table, which gives the figures of a dozen English surgeons

		Cases.	Died.	Mortality Percentage
Caird F M	1896–1903	54	34	63.0
	1904–1913	193	71	36.7
Short R.	1911	8	26	44.0
Sargent P	1904	49	21	41.9
Morley J	1912	112	48	42.9
Sherren J	912	23	12	42.8
Rutherford J	1920	90	20	22.2
Southam A H	1922	40	3	9.0
Mills P	1925	40	11	27.5
Monaghan J ...	1920–1925	237	55	45.0
Turner G G	1923–1927	194	48	24.7
Williams and Walsh ...	1922–1929	148	47	29.7
Watson J H	1922–1930	110	21	19.1
		1,363	417	31.6

Undoubtedly with earlier diagnosis and prompt surgical treatment this high mortality rate should be very considerably lowered in the future, in fact, Professor Young of Glasgow had a remarkable series of 17 cases of perforation of pyloro-duodenal ulcers between July, 1926, and July, 1927, without a death, and remarks that thirty years ago such a succession of good recoveries would have been regarded as impossible

The series of 110 cases of perforating gastric and duodenal ulcers here recorded include 7 occurring in my private practice, and the remaining 103 in hospital practice (Victoria Hospital, Burnley, 85 cases Reedyford Hospital, Nelson, 14 cases Hartley Hospital Colne 4 cases) Of this number 20 have been operated on by my colleagues, Messrs Mackenzie, McCreadie and Davidson at the Victoria Hospital

In this list there are only eight women patients and of these six were labelled gastric perforations and two duodenal Of the 102 cases occurring in males roughly one-sixth are recorded as being situated in the pyloric portion of the stomach and the other five sixths perforated either at the pyloro-duodenal junction or in the duodenum

There was one case only of a posterior perforation occurring in a man aged 63 years another perforation was recorded as being about the middle of the lesser curvature and there were two other cases in which perforation took place nearer the cardia

As to the age incidence the conditions appear to be most common in the third and fourth decades the youngest

* Read before the Manchester Surgical Society March 13th 1930.

subject being 16 years, the oldest 67 both these had distal ulcers close to the pyloro-duodenal junction In my experience this acute abdominal crisis occurs most frequently in the winter months, especially about Christmas time No case of perforating malignant ulcer has been included

As a general rule there was a previous history of indigestion over a varying period of a few months to several years There were, however, two instances in which the history of previous ulcer symptoms was doubtful The time between the acute symptoms and the time of operation has unfortunately not been accurately recorded, but I have a series of cases from one hospital (Nelson) in which these data have been carefully noted, and it varies from two hours to sixteen hours, the average interval accordingly is seven hours in these cases

Age	Occupation	Site	History	Operation	Perforated	Result
			Years		Hours	
29	Clerk	D U	5	25 6/25	5	Good health
31	Ex soldier	D U	Nil	15 10/26	6	Good health
49	Weaver	G D U	2	3/6/27	6	Good health
53	Postman	D U	1	4/5 27	16	Occasional indigestion
45	Shopman	D U	3	7/6/27	3	Good health
45	Twister	D U	4	31/7/27	5	Occasional indigestion
39	Weaver	D U	1½	5/3/28	6	Good health
38	Overlooker	D U	10	1/9/28	7	Good health
58	Weaver	D U	2	31/10/28	4	Good health
36	Weaver	P U	6	6/1/29	2	Good health
44	Weaver	G D U	3	19/12/29	14	Died 3 hours
41	Manager	G D U	3	21/12/29	4	Died 24 hours
31	Weaver	P U	2	8/1/30	6	Good health

In my experience the most common causes of death in the fatal cases have been (1) shock from perforation and operation, (2) peritonitis and paralytic ileus, and (3) broncho-pneumonia

When considering the site of the perforation it is interesting to compare a series of diagrammatic representations given by various authorities during the past twenty-five years (for instance, those of Sargent,[1] Morley, Deaver,[3] Stewart,[4] Linhorn[5]) It will be seen that most of the ulcers are indicated as being near the lesser curvature, and in the later diagrams most are located in the neighbourhood of the pylorus, with a definite majority on the duodenal side Posterior perforations are relatively rare, and practically none seem to occur near the greater curvature

My experience leads me to believe that perforating ulcers, particularly of the duodenum, have become more frequent in recent years, especially in men The men affected are mostly of the artisan class employed in mills and workshops, who are careless about their food, their habits, and general mode of living

The first cases I had to deal with twenty years ago were generally gastric ulcers which had perforated some days previously and were admitted to hospital with a subphrenic abscess one woman, I remember, vomited a large amount of purulent material and died shortly after admission At the post-mortem examination there was discovered a subphrenic abscess connected with an abscess at the base of the right lung

The incidence of proximal perforations (gastric) is said to be more frequent in women than men, but I have not seen a case of perforated gastric or duodenal ulcer in a woman in the last two years It is difficult to account for this increased number of perforating ulcers in men, I have no satisfactory explanation to offer, but I am quite sure that they are being discovered earlier and more often, for which full credit must be given to the general practitioner

Peritonitis resulting from leaks of this character fortunately differs materially from peritonitis resulting from an acute perforating appendix It is less virulent for at least two reasons (1) the contents of the stomach and duodenum are practically sterile shortly after a meal, (2) the patient is most likely a chronic dyspeptic and is probably taking only small quantities of light food When, therefore, rupture occurs as it does most frequently three or four hours after a meal, the extravasation is in many cases sterile This is not an absolute rule Dugeon[6] found streptococci present in 12 out of 23 cases, but the organism was of low virulence The *Staphylococcus albus* was present in 10 cases, a sterile exudate in 5, but he emphasizes the fact that when the colon bacillus is present the infection is always more severe The time at which perforation occurs is therefore highly important as regards the toxicity of the exudate Perforations occurring late during the process of gastric digestion are often more or less innocuous because of the small number and low virulence of the bacteria present This is a very good reason for not draining the peritoneum which is well able to take care of this type of infection if the primary leak is promptly controlled When however, the rupture occurs immediately after the digestion of a large meal with plenty of fluid, and where the amount of extravasation is great, the response of the peritoneum is by no means so satisfactory and the resulting infection may even be overwhelming

GROSS PATHOLOGY

There are certain striking gross pathological features of these juxtapyloric ulcers which call for remark In the first instance they may be grouped into pre-pyloric and post-pyloric types

Pre-pyloric Type —There is usually considerable infiltration and thickening of the wall of the pylorus, thus encroaching on the lumen adhesions may or may not be present

Post-pyloric Type —This type presents a varying amount of scar tissue, depending on the kind of ulcer which may be (*a*) Medium sized ulcer with considerable scar tissue formation and more or less extensive adhesions deforming and constricting the lumen the ulcer tends to spread on to the pylorus (*b*) Small ulcer with slightly indurated base, there is a marked absence of adhesions (*c*) Multiple ulcers of the so-called "kissing" type are rare

The perforation may vary from pin-point to 6 mm or 7 mm in diameter, and is typically a punched-out hole in the crater of the ulcer Generally speaking most acute perforating duodenal ulcers are single, round, slightly indurated, 1 cm to 2 cm in diameter, nearly always on the anterior surface of the first one and a half inches of the duodenum A great number occur in the duodeno-pyloric fornix, as pointed out by Jefferson[7] The depth of this sulcus varies considerably being shallow in relaxed hypotonic stomachs and well marked in gastric ulcer, where gastric hypertonus is the rule These duodeno-pyloric (Jefferson) or pyloro-duodenal (Young) ulcers are for the most part duodenal, but because the pyloric veins are frequently obliterated in these cases many have been probably classified wrongly as pyloric ulcers

When once an ulcer has eroded through the mucous coat and well into the muscular lining of a hollow viscus its progress depends primarily on two circumstances either the serosa becomes glued to some adjacent structure or an acute abdominal crisis is precipitated by sudden rupture The ulcers which are most likely to perforate into the general peritoneal cavity are obviously those on the anterior wall of the stomach and duodenum, where the possibility of the formation of adhesions is least probable When destruction has proceeded to such an extent that the subperitoneal coat is reached, a sudden intense muscular spasm is likely to cause a rupture of the ulcer base

From the above-mentioned pathology these perforating ulcers may, for practical purposes be placed in two classes (1) *the smaller ulcers with little induration*, (2) *the larger* calloused ulcers, causing more or less deformity and producing a varying amount of obstruction to the exit of food from the stomach

The condition of the peritoneum at the time of operation depends in general upon the time that has elapsed since the actual perforation I have found that the amount of fluid present within the peritoneal sac is very variable, even in the early cases, generally speaking, there is more

in cases of duodenal ulcer than in cases of gastric ulcer This may be accounted for partly by the fact that the duodenal perforations are, on the average, larger than the gastric, further, the callous pyloric ulcer is often associated with a contracted and deformed lumen which blocks to some extent the escape of the contents Much depends also on whether the unfortunate patient has been plied with drinks of various kinds administered by anxious and well meaning relatives and on the intensity of the pylorospasm As might be expected many of my cases of the duodenal type perforated at a time when the stomach was or should have been empty—that is when they were finishing the morning or afternoon work or going to bed at night—at a time when they would be beginning to feel hunger pains

The response of the peritoneum to this leaking fluid I have found to be very variable As a rule in the early stages the gastric contents are more irritant than the duodenal there seems to be more sero-pus and inflammatory lymph deposited about a leaking gastric ulcer The duodenal contents fortunately are deflected to Morrison's pouch and are then diverted to the pelvis along the outer side of the ascending colon so there may at first be very *little evidence of peritoneal irritation*

Apart from the extravasated fluid in these cases there is probably a considerable exudate produced by the peritoneum itself On every occasion I have tested the accumulated fluid it has been neutral to litmus There is a considerable amount of mucus in some instances, and bile, in large amount, in late cases of duodenal perforation I have rarely seen particles of undigested food, the amount of free gas in the peritoneal cavity is also very variable I have never had occasion or the opportunity to demonstrate a pneumo-peritoneum by radiography As time goes on the peritoneal exudate becomes more purulent, and it is an established fact that after six hours, the majority of cases are infected with staphylococci streptococci, and *Bacillus coli communis* of virulent type *hence the need* of a rapid and careful peritoneal toilet In late cases with profound infection the peritoneal vessels will be found engorged with dark venous blood and there is little or no bleeding from the wound—a bad omen

Symptomatology

The description by Travers already given, of the onset of the symptoms is brief, exact, and impressive I have failed to find any other written account which gives so accurately the predominant signs For the sake of analysis they may be tabulated

1 Acute onset of agonizing pain which entirely absorbs the patient's attention
2. General deep tenderness of the abdominal wall
3 Early and intense boardlike rigidity of the flat muscles of the abdominal wall

In addition to these definite and most urgent symptoms there is usually associated

4 A slow pulse of good volume and slightly raised or normal blood pressure in this early stage
5 A subnormal or normal temperature
6 Nausea and vomiting present in the majority of cases
7 Shallow and rapid breathing (upper thoracic type)

Other less constant signs may be noted or elicited such as superficial hyperalgesia, shoulder-tip pain, pallor and flushing of the face, sweating of the head and chest, pneumo-peritoneum, and loss of liver dullness The patient is frequently very restless moaning and groaning with pain, occasionally he holds himself very rigidly, lying on the back with the knees flexed The presence of free fluid in the abdomen abdominal distension, cold extremities, and evidences of profound shock and toxaemia are very late and ominous signs

Of the predominant symptoms I have just tabulated the most urgent is undoubtedly the agonizing pain which is usually referred by the patient to the epigastric region I have found difficulty in judging the exact site because the patient is so distraught by his suffering that he cannot sufficiently concentrate to give reliable answers, and usually dismisses the question abruptly by saying It is all over," or "Give me something to ease the pain"

As to the actual cause of the intense pain much has been written of a more or less discursive and indefinite character, this is probably due in part to the fact that our knowledge of the visceral nerves and their function is as yet incompletely understood

We know that visceral organs are not subjected to the same kind of stimuli as those which constantly play upon the surface receptors further, hollow viscera are insensitive to these particular forms of stimulation (mechanical thermal, electrical) In the usual course of events the reactions called forth in visceral organs do not affect consciousness, on the other hand abnormal visceral stimuli give rise to sensations which are commonly referred to a somatic area removed from the point of stimulation

The normal functioning of a hollow organ like the stomach involves the contraction of smooth muscle but under physiological conditions this does not generally give rise to sensations The actual adequate stimulus for the production of pain in the stomach which is the seat of an ulcer and which has suddenly perforated must in some way be related to the contraction of the unstriped musculature This is what Mackenzie[1] termed the production of pain by a "vital" stimulus as opposed to the "mechanical" stimulus which is adequate to produce pain in other tissues The predominating result is pain referred to certain areas of the outer body wall but the impulse may spread widely according to the intensity of the stimulus and so progressively involve other visceral centres in the central nervous system, by this means producing vasomotor, cardiac, respiratory, and other reflex disturbances

Hughson[2] has expressed the opinion, from his experimental studies on dogs, that spasm of the pylorus from disease within the abdominal cavity is caused by irritation of the peritoneal surface It is evident that with a *perforation there is immediate soiling of the peritoneal* surface by an irritant fluid which would accordingly be sufficient to cause an intense reaction in the nature of a violent pylorospasm, reflex in character, and involving both vagal and sympathetic neurons It has been shown by fluoroscopic examinations of patients with gastric ulcer that the pain in many instances coincides with the appearance of peristaltic contractions sweeping over the pyloric portion towards the contracted pylorus

The operative findings in cases of perforating ulcers confirming these statements have so far as I am aware not been recorded but I have on several occasions noted the sphincter pylori standing out as a thickened pallid band, and found on exploring the pylorus from the duodenal side that the pyloric canal was so contracted that it was difficult to find, and could only be forced by strong digital pressure This narrowing of the lumen, I observed, was not due to a cicatricial constriction but to a contracted sphincter pylori, which gave way to steady pressure, and on dividing the sphincter later the hypertrophied muscle fibres were clearly demonstrated

Mackenzie's early personal experiences as a surgeon in the first instance led him to believe that the violent contraction of the smooth muscle of a hollow viscus was the major factor in the production of visceral pain, and the weight of evidence to my mind appears to support his argument that under certain circumstances when the contractions of a hollow muscular canal like the pylorus become violent or spastic, or when the blood supply to the muscle is greatly diminished the contraction of smooth muscle gives rise to pain, in fact the most severe pains in the epigastric region are probably due to pylorospasm

This pylorospasm depends upon an excessive activity of the visceral nerves of the stomach and duodenum the stimuli they conduct create according to Mackenzie an irritable focus in the spinal cord (seven to twelve dorsal segments roughly) This condition of hyperexcitability profoundly affects the reception and conduction of various regional impulses so much so that an ordinary tactile impulse in passing through this disturbed centre is exaggerated that it produces a painful impression in the sensorium Further the afferent visceral stimuli may also bring about the phenomenon of referred pain in which the impulse is actually conducted to the surface reflexly from the central nervous system along the somatic afferent nerve and again by a process of irradiation to other neighbouring visceral segments various other reflex symptoms of an organic [illegible] manifestations

So far as my observations go superficial sensation does not as a rule appear to be increased in these acute cases, it is only on rare occasions I have been able to demonstrate any actual area of superficial hyperalgesia either of the abdominal wall or about the shoulder tip But any attempt at deep palpation of the muscles of the anterior abdominal wall will cause severe pain This tenderness is associated with a rigidly contracted muscle (viscero-motor reflex) and is but an exaggeration of the normal reflex which maintains the tone of these muscles The reflexes involved in muscular guarding and rigidity are conveyed in part through reflex arcs, which may comprise both sympathetic and somatic neurons Nevertheless a degree of pressure which when applied to other muscles of the body gives rise merely to a sensation, brings forth in these rigid muscles a sensation of severe pain This can only mean some special influence is being exerted on these tender muscles, the effect of which is to increase the intensity of their reaction to stimulation—namely, a hyper-excitable centre in the segment of the spinal cord which is associated with the viscus in question

The fact that the pulse is slow and of good volume in the early stages is an important feature to note, for despite the fact that even recent textbooks still affirm that the pulse is small and thready I have never felt a rapid small pulse in an early case I have on several occasions had the blood pressure taken and found either a slightly raised or normal blood pressure (140 to 160 systolic)—never an early fall in blood pressure, so that the general statement that shock is a predominant feature in the early cases may and does lead to delay in making a diagnosis, for on several occasions I have been called out to these cases, and the doctor in charge invariably contended that as the pulse was so good he could not conceive that the pain was the result of an acute perforation Later, of course, the pulse does become small and rapid, and there is a big drop in the blood pressure, but when this stage arrives the prospect of successful surgical treatment is getting beyond the realms of possibility

With regard to nausea and vomiting, in all cases of intense pylorospasm and pain in the epigastrium there is reflex inhibition of the cardia from sympathetic influences, and at the same time there is the intense contraction of the abdominal muscles, but this is not spasmodic, so that actual vomiting is very slight or may be absent, and at the most consists chiefly of attempts to get rid of very viscid salivary secretion

Respiratory difficulties are commonly observed to accompany acute abdominal disorders The rapid and shallow respiratory movement is due to the fixation of the lower chest, principally by reflex spasm of the lower intercostals (fifth to twelfth) and the peripheral portions of the diaphragm (innervated by lower intercostal nerves) The dyspnœa takes the form of difficulty with the inspiratory phase of the respiratory cycle, particularly on an attempt at deep inspiration

In addition to these predominant signs we meet with the other more variable ones, such as the pallor and flushing of the face, sweating of the face and upper chest, easily provoked pilomotor reflexes, and dilatation of the pupil These secondary symptoms can also be explained on the theory of disturbed reflexes due to spreading from a hyperexcitable centre in the spinal cord, and by diffusion affecting secondary centres which give rise to the unusual or abnormal vasomotor, secretory, pilomotor, and pupillary reactions

Treatment

The only treatment for an acute perforating ulcer is operative, and should follow promptly on the diagnosis, with an early diagnosis in an otherwise good surgical risk the chance of cure is infinitely better to-day than the statistics previously quoted suggest Even after allowing for bad risks, the mortality should not exceed 5 per cent, granted an early diagnosis and that an immediate operation is performed

One of the first surgeons in this country to give serious consideration to active surgical intervention in these cases was Dobson of Bristol, who in 1883 published a paper in the *Bristol Medico-Chirurgical Journal* on a case of perforated gastric ulcer, and suggested as treatment early laparotomy, cleansing of the peritoneum, and suture of the perforated ulcer, if this last were not possible, the formation of a gastric fistula

Eleven years later, 1894, Pearce Gould, discussing the operative treatment of perforating gastric ulcers of the stomach and intestine, advocated the following measures (1) simple washing out of the peritoneal sac and drainage, (2) suture of the ulcer, with or without excision of the edges and cleansing of the peritoneum (3) formation of a gastric fistula or drainage of the stomach with cleansing of the peritoneum His great contention was that

"The key to the position lies in the perfect cleansing of the fouled peritoneum for nearly every case of failure of the operation has been due to the imperfect cleansing of the serous sac and continuance of the peritonitis"

The method of cleansing advised was irrigation which took the form of flushing from a douche can or with the use of a Higginson syringe the solutions preferred for this purpose being either plain boiled water or normal saline, but weak antiseptic solutions (boric, carbolic, and creolin) were utilized by Morris and other believers in the antiseptic system Drainage of the pelvis was instituted in every case, and as a rule, a drainage tube was led down to the site of the lesion

In 1897 Braun of Leipzig published the first case of successful suture in which a piece of omentum was grafted over the perforation, and an anterior gastro-enterostomy completed the operation Shortly afterwards Moynihan, Patterson, and other British surgeons began to combine the posterior operation with simple suture, and for a time this was the method adopted by the majority of surgeons

Mothersole[10] published in 1906 two cases of resection and suture of perforated gastric ulcer

Mills[11] reported in a series of 40 cases published in 1925, better results with the combined operation than with simple suture, but he admits that he performed the simpler operation only in the most serious cases

Bager's[12] figures, collected from fifty hospitals in Sweden are very interesting He has collected 1 767 cases operated upon by about a hundred surgeons during the period 1911 to 1925 Of these, 684 had the operation of simple suture, the mortality being 36 4 per cent, in 616 cases the suture was supplemented by gastro-enterostomy, and the mortality was 23 4 per cent 84 cases were treated by resection, with a mortality of 25 per cent, in 111 cases in which simple tamponage or drainage alone was instituted the mortality rose to 68 5 per cent He says that the poorer results of simple suture compared with the combined operation of suture and gastro-enterostomy, were due undoubtedly to the fact that patients treated by suture alone were the worst operative risks, further, he remarks that cases treated by suture would not have been improved by gastro-enterostomy, but in the cases treated by gastro-enterostomy the mortality would have been somewhat lower had the suture method been adopted For similar reasons he is convinced that the cases treated by gastric resection were good operative risks and that the mortality would certainly have been reduced had less radical measures been adopted

For some years past I have personally given up the combined operation, being convinced in my own mind that the simplest surgical procedures which will correct the defective anatomical findings will give the best results I venture to submit that in the majority of these cases the quickest, simplest, safest, and most effective technique is to excise the ulcer-bearing area, divide the sphincter pylori, and unite the cut edges of this open wound at right angles to the long axis of the gastro-duodenal tract By this method the ulcerated area is removed, any secondary ulcer can be seen and treated, a better union is obtainable by the suture of healthy tissues, constriction of the lumen is avoided, and the prospect of future obstruction of the outlet to the stomach greatly lessened, if not entirely obviated

The operation is performed under local anæsthesia combined with the administration of ether oxygen Occasionally in late cases, the operation has been performed with local anæsthesia alone, following Pauchet's technique The abdomen is opened with a paramedian or median incision, the liver is at once lifted up and the stomach grasped by an assistant and pulled over to the left By using a moist gauze abdominal compress over the hole is obtained, and by this means further leakage will be controlled If there is a considerable amount of fluid in the abdomen and pelvis a suprapubic puncture can be done at this stage, and a wide, split rubber tube inserted to the bottom of the pouch of Douglas thus instituting early drainage Hot gauze packs rung out of saline are then placed in Morrison's pouch and below and internal to the site of the lesion being tucked downwards towards the pelvis A good view of the perforation must be obtained if an excision of the ulcer bearing area is to be undertaken The excision is made in the

form of a square with the diagonal lengthwise if the sphincter pylori is not included the incision is continued through its centre In those cases in which the sphincter is considerably thickened, a wedge is removed on either side of the incision The sutures are then placed after the manner of a Horsley's pyloroplasty an inner layer of interrupted through and through sutures of No 1 catgut and a superimposed layer of Lambert sutures of linen or silk The packs are now removed, and further pockets of exudate mopped up gently with moist gauze After this toilet of the peritoneum the wound is carefully closed in layers without any local drainage but the pelvic drainage tube is kept in for twenty four to forty eight hours. No drainage at all is required in early cases with little extravasation and no form of irrigation is attempted

Immediately after the operation the patient is given a pint of glucose and sodium carbonate solution (5 per cent) per rectum If there are indications of shock as indicated by a weak and rapid pulse and low blood pressure a subcutaneous or intravenous saline is administered the patient is returned to bed, maintained in the recumbent position radiant heat is applied to the abdomen and the patient is kept under the influence of morphine The patient is not raised to the Fowler position until the pulse shows a considerable improvement but on no account is any use made of pituitary extracts

TWO APPARENTLY UNRELATED OUTBREAKS OF BACILLARY DYSENTERY

BY

A T W POWELL M C, M B, B S, D P H,

LATE MEDICAL OFFICER OF HEALTH SCUNTHORPE AND FRODINGHAM URBAN DISTRICT COUNCIL.

A FAIRLY extensive literature has of late accumulated with regard to bacillary dysentery in Great Britain, suggesting that the disease is endemic and that its unusual prevalence during the past few years is probably only the result of more careful investigation

The last twenty-four years have shown one or more outbreaks of bacillary dysentery in at least eleven areas, even so the following recital is probably incomplete 1906 Birmingham[1], 1911 Paddington[2], 1915, Blackwell rural district[3] (1,000 to 1 700 cases of diarrhoea mainly dysenteric in character associated with pollution of water supply), 1921, Ogmore and Garw urban district[4] (1 100 cases—probably a water-borne infection), 1922 Lynton urban district[5] (18 cases due to milk-borne infection) 1923 to 1926, Aberdeen[6] (about eight outbreaks, totalling 50 cases), 1925 Ayr (five groups of 12 cases), 1926, St Andrews (150 cases)[7] 1928, Smethwick[8] 1928, Newcastle[10] (141 cases) Further cases are referred to by Nabarro,[12] Clayton,[13] and Warren [14]

Textbook descriptions of bacillary dysentery postulate epidemicity where sanitation is defective or where water and milk supplies are infected Endemicity is regarded as the normal in Eastern cities while the occasional outbreaks in this country are relegated to asylums The following account of the Flexner and Sonne outbreaks in Scunthorpe will help to refute the foregoing ideas, and will support the statements of other observers (Fraser etc,[6] Wiseman,[7] Fyfe,[8] Charles and Warren [11] Nabarro,[12] and Warren[14]), regarding the marked variation in virulence and the unrecognized prevalence of bacillary dysentery

The Aberdeen, Newcastle St Andrews and Ayr outbreaks in particular emphasized the variable virulence both of Sonne and of Flexner infections Sonne infections appear to have been regarded as the less serious which agrees with Thjötta's observation that the resultant diarrhoea is often not serious enough to warrant the attention of a physician On the other hand some of the Aberdeen Sonne infections could definitely be subdivided into severe and mild groups—the former again being subdivided into two further groups The more serious Flexner type of infection at Newcastle proved especially virulent among children, while adults appeared immune The experience of the Scunthorpe series agrees in detail with the observations Another curious analogy with the Newcastle[10] cases is that in both areas the outbreaks were at first regarded as food poisoning several members of a family being taken ill, with fatalities resulting

Flexner Outbreak

On February 4th 1930, a message was received from the doctor in attendance that the four children aged 3 to 10 years, of a working-class family residing at Ashby Scunthorpe were suffering from what was believed to be food poisoning

The house was at once visited and one child (Be C) aged 5 years was found to be dying There was marked dyspnoea and Kernig's sign was present No pulse could be felt, no head retraction was observed, and the temperature was 100° F The history was that the child had first been taken ill four days previously, complaining of abdominal pain, headache and diarrhoea Death occurred on February 4th Ba G aged 8 years, was said to have been delirious on the evening of February 3rd and within twenty-four hours had a temperature of 102° F with abdominal pain and diarrhoea A G aged 10, had headache on the morning of February 4th, but wanted to go to school By the evening the pulse was 140 and the temperature was 103° F with abdominal pain and diarrhoea S G had a similar onset the symptoms being complicated by whooping-cough of about seven days duration Both the father—an ironworker—and mother were quite well

On revisiting the patients with the family doctor in the evening the three surviving children were found to be extremely ill with almost constant diarrhoea the motions being greenish black in colour resembling spinach and emitting a peculiar smell which, later, was realized to be almost pathognomonic There was no obvious blood or mucus and apparently no vomiting No splenic enlargement could be discovered, and no rose spots were seen Specimens of faeces were obtained from each surviving child A tentative diagnosis of food poisoning was made but an hour's close questioning failed to suggest any incriminated foodstuff

The routine procedure suggested by the Ministry of Health was followed and four food samples were sent to the Ministry's laboratory for examination In view of the earlier results obtained from the examination of faeces the examination of foodstuffs was not considered necessary A post-mortem examination was carried out on the fatal case (Be C) on February 5th by the patient doctor, and evidence of an enteritis was found The following specimens were sent to the Ministry's laboratory (*a*) small intestine, (*b*) kidney, (*c*) spleen (*d*) section of liver, (*e*) stomach Unfortunately no part of the large intestine was sent On February 5th the condition of the patients was critical especially that of the youngest child S G Specimens of blood were obtained from the parents and the two children A G and Ba G and dispatched to the Ministry's laboratory

The house involved was one of nine scattered old houses forming an isolated courtyard with a common water supply from a shallow well Immediate instructions were given to boil all water before use Four pail closet were in use at the onset of the outbreak The property generally speaking was old but in fair habitable condition Only one house was overcrowded by two families of four adults and nine children New accommodation was found for the subtenant

Detailed inquiries were made at all the remaining eight houses but no history of illness was obtained except from the overcrowded cottage where the five children of the

K family were said to have had bloodstained diarrhoea about the beginning of January. The children when seen on February 5th were quite fit, and no doctor had been called in during their illness.

Pasteurized milk was in use at three houses (including the G and K families) and raw milk from another dealer at four houses, while the two remaining houses used milk from both sources.

The condition of the three sick children of the G family remained much the same on February 6th, with continuation of marked diarrhoea, which showed bright red blood on the evening of that day. There was some remission of the pyrexia.

On February 7th a telegram was received from the Ministry stating that W type Flexner dysentery bacilli had been found in the faecal specimens of two of the three G children. A C and Ba G were at once removed to an infectious diseases hospital, but the toxaemic condition of S G precluded removal. Polyvalent anti-dysenteric serum was *asked for*.

Further inquiries were then instituted for dysentery carriers and an indefinite history was obtained from Mr K, whose children had been ill in January. *Blood* specimens were sent to the Ministry's laboratory from both parents and from two of the five children (L K and B K) who had been the most seriously affected. Normal agglutinations were given by the parents' bloods, while those of the children gave slight but definite evidence of Flexner infection (titre 80 in 160). F K's faeces on February 9th were normal and negative, although she was said to have had slight diarrhoea on February 8th.

Eighty c.cm. of antidysentery serum was administered to the surviving sick child (S G) on February 8th, but death occurred later in the day.

Prophylactic doses of 10 c.cm. were given to three of four women who had taken turns in nursing the sick children and 30 c.cm. to the fourth (Mrs M), who was found to be in bed ill with diarrhoea. A specimen of faeces was obtained prior to this patient's removal to hospital as a suspected case. The report received subsequently showed the presence of a few colonies of Flexner W.

Following the receipt of the Ministry's telegram circulars were sent to the medical practitioners of the district requesting notification of any suspicious cases—dysentery being notifiable under the Public Health (Pneumonia, Malaria, and Dysentery) Regulations, 1919. As a result two groups of cases—(*a*) Dr E and S T, and (*b*) Mrs R—were investigated in different parts of the district. Although blood-stained diarrhoea had occurred in each case *the agglutinations were all negative*.

No further developments took place until February 10*th*, *when* Mrs B, *who had assisted in the nursing of the G children, complained of* diarrhoea with mucus and blood. The stools when seen presented the classical "red currant jelly" appearance. Culture from a specimen obtained on February 11th showed numerous colonies of Flexner W, and removal to hospital was effected on the same day. Prophylactic doses of serum were given to the remaining members of the B household.

As soon as the true nature of the outbreak was realized the Ministry of Health was requested to send assistance, with the object of trying to locate the source of infection. Dr N R Beattie visited the district on February 12th and 13th, but in spite of the closest investigation no definite source of infection could be found. An attempt was made, however, to link up the infections between the K and G families. The members of the K family were the only unsatisfactory tenants in this particular group of houses, and it was found that they had been allocated a pail closet for their own use, while the remaining eight families shared the other three. One of the elder K children admitted having used the pail closet allocated to the G family. In view of the fact that the K children had suffered from undiagnosed dysentery in January it may be possible that the infection was transmitted in this way to the G children. On the other hand, the family of subtenants (including three young children) who lived with the K family from January 12*th* to February 11th, suffered from *no suspicious symptoms*. A specimen of faeces could not be obtained from Mr G (who had given an indefinite history of dysentery during the South African and European wars) until February 19th. This proved to be negative, and the outbreak was by then considered to have subsided.

On March 1st F K was reported to be passing blood and mucus, the only symptoms being slight abdominal pain. On the following day a small quantity of almost pure blood and mucus was passed, and a specimen showed the presence of numerous colonies of Flexner W. The child undoubtedly had a "relapse," in view of the definite agglutination given by her blood on February 7th and the negative faeces of February 9th. Hospital removal was therefore effected on March 5th, and a negative stool was obtained by March 11th, the stools in fact having become quite normal in appearance by March 3rd before hospitalization.

On March 19th Mrs K was reported to be ill, and blood and mucus were passed on the 21st. Specimens of stools were sent for examination, and showed an abundant growth of Flexner W. In view of the negative agglutination of *February 7th the patient had, curiously*, escaped infection during the January infections in her own home, and again during E K's relapse of March 1st. E K had returned from hospital on March 17th. A specimen of blood from Mrs K on April 2nd showed a "suspicious" agglutination against Flexner W in a titre of 30. A previous specimen on February 7th had shown normal agglutination only.

On April 8th J K was said to have passed blood and mucus, although the child was not ill and had a normal temperature. On the following day there was slight mucus but no blood, and a specimen showed Flexner W to be present. On receipt of the report the child was removed to hospital, where no treatment was necessary, and she was discharged on April 17th following a negative stool. Although no serological evidence had been previously obtained J K's case was undoubtedly a "relapse."

This group of Flexner W infection therefore comprises 11 cases, 7 of which gave definite bacteriological evidence, and 2 serological, while the remaining 2 although negative bacteriologically, were quite definite clinically—one in fact being fatal. Of the 11 patients 3 were adults (all females) and 8 were children (7 females and 1 male). In addition, two other patients were removed to hospital as suspects, but were subsequently found not to be suffering from bacillary dysentery. The population at risk in this isolated group of houses consisted of 21 adults (7 male and 14 female) and 14 children (13 females and 1 male).

The cases are interesting inasmuch as the infection "bred true" throughout, in view of the greatly increased virulence in the children of one family (2 deaths), the occurrence of two "relapses", and because *no source of* infection could be discovered—an experience typical of all other outbreaks, except those due to infected water or milk.

Diagnosis was confirmed by faecal culture tests, while agglutination tests were only found to be useful accessories (see Charles and Warren[11]). For successful faecal tests the specimens had to be obtained early. One negative stool was considered sufficient for discharge from hospital.

Sonne Outbreak.

On April 10th a message was received from a doctor that there had been suspicious diarrhoea affecting a household next door to one where he was visiting. This house was also situated in Ashby, but at a considerable distance from the venue of the Flexner cases. A visit disclosed that a child, L M, aged 2, had complained of diarrhoea with blood and mucus about the end of March. It was stated that she had experienced similar attacks previously.

The father, an ironworker at the same works as Mr G of the Flexner series, had been taken suddenly ill while at work about the beginning of April. Blood and mucus had been passed, but no medical attention had been sought. No connexion could be made out between Messrs G and M.

TABLE OF LABORATORY INVESTIGATIONS

Flexner Cases

Date	Patient's Initials	Specimen	Result
1930			
Feb 5	A. G	Faeces	Flexner W in considerable numbers
	Ba. G	"	No B dysenteriae
	S. G	"	Flexner W in small numbers.
	Be. G	P.M. Organs	No B dysenteriae (large intestine no rent)
"	Mr C	Blood	No agglutination against Flexner W
	Mrs. G	"	Agglutinated Flexner W 1 in 40 (? significance)
	A. G	"	No agglutination Flexner W
	Ba. G	"	Insufficient serum
Feb 7	Mr. h	"	Normal agglutination.
	Mrs. h.	"	Ditto.
	F. K	"	Agglutinated Flexner W 80 in 160 (slight but definite)
"	R. h.	"	Ditto
Feb 8	Mrs. M	Faeces	Flexner W a few colonies
Feb 9	E. h	"	No P. dysenteriae
Feb 11	Mrs. R.	"	Flexner W numerous colonies
"	Mrs R	"	No B dysenteriae.
Feb 13	"	Blood	No agglutination to Flexner W
"	Dr E	"	Ditto
"	S T	"	Ditto
Feb 17		Water sample	Colonies on agar D 37 C = 12 per c.cm. Presumptive B. coli plus in 5 c.cm. No dysentery bacilli on plating 800 c.cm.
Feb 19	Mr h.	Faeces	No B dysenteriae
March 2	E. K.	"	Flexner W numerous colonies. (See reports on Feb. 7th and 9th.)
March 11	F. h	"	No B. dysenteriae (hospital clearance)
	Mrs B	"	Ditto
March 23	Mrs K.	"	Flexner W (abundant)
March 31	M. H.	"	No B dysenteriae
April 2	Mrs. K.	Blood	Flexner W agglutinated 1 in 40 (Compare with blood of Feb. 7th—that is, suspicious)
April 9	Mrs K.	Faeces	No B. dysenteriae (hospital clearance)
"	J. h.	"	Flexner W present
April 15	J. K.	"	No B. dysenteriae (hospital clearance)
		Sonne Cases	
April 12	Mr M	Blood	Haemolysed on arrival at laboratory
"	F. M.	Faeces	B. dysenteriae Sonne (pure culture)
April 23	F. M	"	No B. dysenteriae (hospital clearance)
April 25	Mrs. M.	"	Ditto
May 2		Water sample	No B. dysenteriae in 100 c.cm.

F. M., aged 6, commenced with similar symptoms on April 10th, and a faecal specimen obtained on the 12th showed Sonne bacilli in pure culture. A blood specimen taken from Mr. M. at the same time was unfortunately haemolysed on arrival at the Ministry's laboratory. F. M. was admitted to hospital on receipt of the bacteriological finding, there was no apparent illness while in hospital and no treatment was given. A negative stool was obtained on April 23rd, after which he was discharged (April 26th).

On April 24th Mrs. M. complained of violent abdominal pain for about two hours, diarrhoea (but no apparent blood and mucus), and vomiting. Temperature and pulse were normal when seen, and a faecal specimen obtained on April 26th was negative. The family also included another child, P. M., and a baby. Both were said to have had very slight similar symptoms. Although Sonne dysentery was only bacteriologically proved in one child (F. M.), there appears little doubt that the whole family of six were affected at one time or another. Mr. A., who lived next door and had been attended by the doctor who had drawn attention to the M. family, had also suffered from diarrhoea at the beginning of April. Unfortunately no bacteriological tests could be carried out.

No possible connexion could be traced with the Flexner series. The milk supply was the same pasteurized supply as that used by some of the Flexner series, but in view of its large sale in the area and the absence of any explosive outbreak it was assumed not to be the source of infection. The shallow well water supply to the house occupied by the M. and G. families showed gross contamination on bacteriological analysis, but no dysentery bacilli were isolated from 100 c.cm.

The accompanying table shows the specimens examined at the Ministry's laboratory.

I would gratefully acknowledge the co-operation of Dr. J. H. Bellamy of Ashby and of Dr. A. H. G. Johnston of Scunthorpe, of Dr. Neil E. Beattie of the Ministry of Health, and particularly of Dr. William Scott, pathologist to the Ministry, who carried out the whole of the laboratory investigation.

THE DIAGNOSIS OF BRAIN ABSCESS

BY

HERBERT V. O'SHEA, M.D., M.Ch., D.L.O.,

ASSISTANT SURGEON, METROPOLITAN EAR, NOSE, AND THROAT HOSPITAL; SENIOR SURGEON, EAR, NOSE, AND THROAT DEPARTMENT, CHILDREN'S HOSPITAL, PLAISTOW

THE diagnosis of brain abscess is often a matter of great difficulty to the surgeon; in some cases while he may be pretty certain of the presence of an abscess he may fail to locate it. For diagnostic purposes brain abscesses may be classified into two groups:

1. Those in which the classical symptoms of abscess of the brain are present. This group may be subdivided as follows: (*a*) Those cases in which localizing symptoms are present where the abscess is caused by direct extension of the infective process. The best examples of this group are the otogenic abscesses, which occur as a result of middle-ear disease and are known as temporo-sphenoidal when they are found in the temporal lobe, and as cerebellar abscess when the cerebellum is the seat of the disease. Another instance of this type of abscess may be found in the frontal area of the brain following suppuration in the frontal or ethmoidal sinuses or injuries in that region of the skull. (*b*) Those in which localizing symptoms are absent—namely, those cases in which the cause is situated at some distance from the abscess and the infective agent is carried by the blood stream. Metastatic abscesses are examples of this kind and are the most difficult to locate. It is well to remember that sometimes otogenic abscesses are formed at some distance from the original focus of infection and have even been found in the opposite side of the brain.

2. Abscesses of the symptomless or latent type, in which there is an entire absence of symptoms and in one case an apparent absence of cause. In this latter type the case of the patient is called before an absolute diagnosis is made owing to the abscess bursting into the lateral ventricles or on the other hand owing to healing by the intervention or acute inflammation which results in a binding down of adhesions formed during the course of the disease and spreading between the dura and brain causing fulminating meningitis and encephalitis.

In the first group the abscess may be acute or chronic, in the second group it must of necessity be chronic In some cases in which the infection spreads very slowly a chronic abscess is formed with such dense fibrous walls that it seems like a solid tumour In these cases, owing to its weight, the abscess may move from its original position and be found either in the fronto-parietal or occipito-parietal region

Examination of the Patient

When tackling a case of suspected abscess of the brain the previous medical history of the patient must be carefully gone into, *and no illness, however slight, may be* ignored An apparently trivial complaint may give a clue to the diagnosis when everything else has failed Thus, in going into the previous history of the case it may be learned that there has been a slight earache at some time or the other which has passed off as quickly as it came, and may or may not have been accompanied by a slight discharge It may then be found that one membrana tympani is not quite normal It may have lost some of its lustre as compared with the normal drum on the other side, or there may be slight thickening, retraction, or evidence of a healed pin-point attic perforation

Again, in the case of an abscess of the frontal lobe there may be a history of frontal headache indicating frontal or sphenoidal sinusitis or ethmoiditis, infection being conveyed directly, or indirectly by the veins In other cases there may be an account of injury in the region of the orbit or nose Fractures, or even a simple contusion without any damage to the bone, may be the cause of a brain abscess These points in the medical history of the patient apply to abscesses due to more or less direct extension of the infection

When dealing with metastatic abscess other signs and symptoms must be looked for The heart must be examined for evidence of valvular disease vegetations conveyed by the blood stream may cause embolic abscess of the brain, often of the frontal lobe The lungs must also be examined, as thrombi, resulting from suppurative conditions such as phthisis, bronchiectasis, pneumonia, and empyema, may be carried by the systemic circulation to the brain

When embolism occurs in cases of pyaemia and leads to breaking down of the cerebral tissue, the middle cerebral artery is usually the vessel affected, the left oftener than the right The symptoms resemble closely those of cerebral haemorrhage, for which it has often been mistaken but usually the parts of the brain affected follow closely the distribution of the artery, while in haemorrhage large areas of the brain may be ploughed up indiscriminately Osteomyelitis and syphilitic disease of the skull bones may give rise to cerebral abscess, in obscure cases, therefore, a Wassermann test should be carried out

Otogenic Abscess

By far the commonest form of brain abscess is that of otogenic origin It is not always easy, when called to see a patient suffering from an intracranial complication following middle-ear disease, to diagnose what the exact condition is Lateral sinus thrombosis, meningitis, and brain abscess are all caused by the pyogenic organisms, usually the streptococcus or staphylococcus, and one or more conditions may be found at the same time Severe pain over the seat of the abscess, with rigors followed by a sharp rise in temperature, may be due to a suppurative pachymeningitis following an extradural abscess In addition there may be a localized swelling over the part owing to the inflamed or oedematous condition of the tissues In such a case as this one finds little or no sign of intracranial tension and thus no localizing symptoms When a subdural abscess forms, the symptoms are similar but more severe

One must bear in mind, especially in [illegible] that an extradural abscess may coexist with [illegible] transmitted in this disease without any symptoms of intr[illegible] hand, the family of even very little suggestion of extrac[illegible] children) who lived the usual discharge from the ear and [illegible]th to February 11th, organ Such a case came under my care about twelve months ago On operating the entire mastoid region was destroyed, a large subperiosteal abscess was evacuated, and an extradural abscess which extended lateral and interior to the sigmoid sinus was opened The sinus was covered with granulations but otherwise healthy, and the patient made a rapid recovery

Abscess caused by chronic middle-ear disease may occur in the temporal lobe as a temporo-sphenoidal abscess, or in the cerebellum The abscess may be adjacent to the diseased bone—namely, the tegmen tympani—and is then due to a direct spread of an extradural or intradural collection of pus In other cases the infection is carried by the veins or perivascular lymph spaces to form an abscess at some distance in the white matter of the brain *The abscess is almost invariably single*, and when headache, vomiting and later optic neuritis occur during the course of chronic middle ear disease, *brain abscess must* be suspected It will further be noticed in such cases that the discharge has ceased, also the *earache, but that* tenderness becomes more pronounced on deep pressure over the temporal or mastoid region A sharp rise in temperature, shivering, and headache generally accompany the formation of pus in the brain This is usually followed by a short latent period in which there are few or no symptoms, but then appear symptoms of compression and toxaemia, the latter due to absorption of pus

In the early stages the difficulty is to differentiate between meningitis and cerebral abscess and in addition, in the case of cerebellar abscess, to exclude acute diffuse labyrinthitis

The following points should be noted in making a differential diagnosis between brain abscess and meningitis

Brain Abscess	*Meningitis*
Pulse Slow and regular	Irregular in rate and force
Temperature Subnormal	Raised
Superficial reflexes Disappear late and are unilateral	Disappear early and are bilateral
Retraction of neck Absent	Usually present
Optic discs Slightly swollen and unilateral	Highly oedematous and bilateral

When meningitis is suspected lumbar puncture should be performed and the cerebro-spinal fluid examined The result of this examination is not always to be relied upon as the fluid may be cloudy but sterile, though a brain abscess is present, or it may be clear and sterile in the presence of purulent meningitis Usually, however, if the fluid is turbid and under tension, and organisms are present one may be sure that the condition is at least a purulent meningitis

When the fluid is clear and the presence of brain abscess is suspected the amount withdrawn should be just enough for the examination This is especially important when there is a chance that the cerebellum may be the seat of the disease, as when too much fluid is withdrawn the foramen magnum may be blocked up by the abscess being pushed down into the spinal canal, and respiration would then cease

Localization of the Abscess

The exact position of the abscess can be localized only by carefully watching for any signs or symptoms that can be assigned to any centre of the cortex or white matter of the brain In the group of otogenic abscesses *localization* is comparatively easy in the metastatic or the latent type it is very different and at times impossible

A temporal lobe abscess of otogenic origin will usually be found on the same side of the brain as the diseased ear The next sign to be looked for is paralysis the presence of which will depend upon whether the abscess is small or large In the former case there is nothing to be seen, in the latter pressure may be exerted superficially on the cortex, the first thing to be noticed being facial paralysis, and later, as the abscess increases in size paralysis of the [illegible]m, and, finally, of the leg In such cases the abscess No[illegible]ated superficially and low down in the temporo- and M[illegible] lobe, and gradually spreads upwards

When the leg is paralysed first, and then the arm and face it shows that the abscess is situated deeply and is pressing on the motor fibre which traverse the internal capsule The speech centre is affected when the left inferior frontal convolution is pressed upon, and motor aphasia results Similarly auditory aphasia occurs when the abscess is situated in the posterior part of the superior temporal convolution Ocular paralysis such as ptosis and strabismus lateralis with a fixed and dilated pupil, denotes pressure on the third cranial nerve of that side Crossed paralysis of the face and limb occurs when the parietal lobe is the seat of the abscess

Generally speaking one-third of the cases of cerebellar abscess are preceded by lateral sinus infection and when the two diseases coexist the symptoms of the one mask those of the other One-third of the cases of cerebellar abscess arising from middle-ear disease follow a suppurative labyrinthitis with complete destruction of the membranous labyrinth In these cases one gets nausea vomiting vertigo etc—in other words symptoms of labyrinthine disease which may immediately precede the formation of the cerebellar abscess or antedate it by months or even years The remaining one-third of the cases of cerebellar abscess are found quite apart from disease of the lateral sinus or labyrinth and occur from direct extension of the infection from the mastoid antrum or cells In these cases an extradural abscess is sometimes encountered on the posterior wall of the petrous bone

A case of otitic cerebellar abscess from which focal symptoms are absent is likely to be mistaken for abscess of the temporal lobe When focal symptoms develop the difficulty lies not in differentiating between a temporosphenoidal and cerebellar abscess but between the latter and acute suppurative labyrinthitis

In the majority of cases when focal symptoms are present the differential diagnosis is easy Vertigo spontaneous nystagmus, Romberg-ism, ataxia etc, suggest cerebellar abscess various aphasias, sensory and motor suggest temporal lobe abscess Since, however these lesions may occur and proceed to a fatal termination with an almost complete absence of localizing symptoms the smaller points must be carefully analysed in order to locate the lesion

Headache is common to both diseases in temporosphenoidal abscess it is less severe varies in intensity from time to time and is usually confined to the temporal region on the affected side In cerebellar abscess as well as being more intense and practically continuous the pain is situated in the occipital lobe on the side of the lesion

Vomiting is always present at the beginning of each lesion, but as the disease progresses the vomiting becomes less frequent or disappears altogether in some cases of temporal lobe abscess while it is frequently seen at irregular intervals in cerebellar disease The nausea and vomiting are unconnected with the intake of food, and may occur several times a day

Mental dullness characterizes temporo-sphenoidal abscess The patient is unable to give his attention to things and has to be roused to answer questions In cerebellar abscess on the other hand, this condition is not present until well towards the end, and is then usually found together with signs of general intracranial pressure.

Vertigo in temporal lobe abscess is a variable and inconstant symptom When present it is due to general increase in intracranial pressure In cerebellar disease vertigo and *ataxia* may appear quite early The individual feels giddy, and tends to fall to the side of the lesion.

Eye changes, such as optic neuritis, inflammation of the papillae, and choked disc are very much more frequent in cerebellar abscess, and this fact may be very important in making a differential diagnosis

Lastly, *muscular paresis*, when present in abscess of the temporal lobe, is always contralateral, while in cerebellar abscess it is sometimes homolateral

Differentiation from Suppurative Labyrinthitis

Before leaving the subject of the differential diagnosis of cerebellar abscess mention must be made of diffuse suppurative labyrinthitis the symptoms of which in the acute stage may resemble those of cerebellar abscess

The principal points in the differential diagnosis are as follows

	Cerebellar Abscess	*Diffuse Suppurative Labyrinthitis in the Acute Stage*
1	Onset gradual	Onset sudden
2	Changing rotatory nystagmus more pronounced to the side of the lesion but may vary with the direction of the eyes first to one side then to the other	Rotatory nystagmus to the sound side increases as the eyes are turned to the sound side and diminishes or ceases when they are turned to the affected side
3	The nystagmus increases as the disease progresses	The nystagmus decreases and tends to disappear by the end of two or three weeks
4	Vertigo is at first influenced by the nystagmus but later becomes persistent even in the absence of the nystagmus	Rotatory vertigo is in the plane of the nystagmus It diminishes and ceases with the disappearance of the nystagmus
5	Ataxia always occurs to the side of the lesion has no particular relation to the direction of the nystagmus present and no tendency to disappear	Ataxia is in the plane of the nystagmus and in the opposite direction to the quick movement It disappears when the nystagmus ceases
6	Caloric reaction present usually normal	Absent
7	Hearing usually normal if only cerebellar disease is present	Entirely lost in affected ear
8	Dysdiadokokinesis and incoordination present	Both absent
9	Finger pointing test shows deviation usually outwards on the side of the lesion Applies only to the limb on the affected side	Deviation occurs in a direction opposite to the quick movement of the nystagmus Both limbs involved
10	Temperature raised at first gradually drop and becomes normal or subnormal	At the onset is elevated, but in uncomplicated cases quickly returns to normal is rarely subnormal.
11.	Pulse rate usually slow Sometimes bradycardia is present with a rise in temperature	Pulse rate normal or varies normally with changes in temperature

When the acute stage has passed on to the latent stage of labyrinthitis the difficulty in diagnosis no longer exists In labyrinthine disease there is complete deafness and the labyrinth ceases to respond to the various tests—an end-result which would not be found in cerebellar abscess

ABSCESS WITHOUT LOCALIZING SIGNS

The next type of brain abscess to be considered also comes under Group I it includes cases with the usual symptoms of brain abscess but presenting no localizing signs In most of these cases the abscess is metastatic and is usually to be found in the white matter of the brain perhaps in the neighbourhood of the internal capsule Sometimes otogenic abscess may form deep in the white matter, following an acute middle-ear inflammation the local condition in the tympanum may have entirely cleared up, while all the time the infection has spread through the dura and finally settled deep in the white matter, leaving no trace of its track, all inflammation having resolved In other cases the inflammation may travel along the perivascular lymphatic vessels to form an abscess some distance away

Another cause of this type of brain abscess is infection from disease of the nose In these cases an examination of the nose and accessory sinuses should be carefully carried out The abscess is usually in the frontal lobe—the silent area of the brain—and though it presents the usual symptoms of abscess it very rarely exhibits focal symptoms In some cases pus may be noticed in the region of the cribriform plate owing to the abscess bursting through the thin plate of bone forming the roof of the nasal cavity in that area

SYMPTOMLESS ABSCESS

Lastly we come to the symptomless or latent variety of brain abscess It is only when rupture occurs that symptoms appear, and then the picture is usually not one of brain abscess, but of overwhelming meningitis which practically always ends

The only remark to be made about these cases is that patients suffering from ear trouble must be watched, whether the condition is just occasional earache or obvious chronic middle-ear disease, also any form of paralysis, whether it be facial, ocular, or of any of the limbs, must be looked out for Any of these signs or symptoms should make one suspicious and decide to keep the individual under close observation

The following account of a case of this type (symptomless) of brain abscess which the author met with a short time ago may be of interest

Mrs X, aged 66 years, was suddenly seized with acute pain in the right ear Within twenty four to thirty six hours the pain gradually subsided, on the appearance of a thick discharge of pus *from the affected ear, and the patient felt much better* No doctor was called, but the patient stayed in bed the next morning Towards the afternoon her maid went to the bedroom and found *her lying on the floor unconscious and clawing the right side of* her head

When I examined the patient I found the condition described above, together with incontinence, facial paralysis on the affected side and slight paresis of the limbs of the opposite side There *was also evidence of meningeal and cerebral irritation* The temperature was 103 5° F On examining the right ear I found no discharge, but a thickened and inflamed drum membrane with a small attic perforation I diagnosed temporo sphenoidal abscess and meningitis following middle ear disease, and my colleague Mr Austin McManus, who also examined her concurred

The prognosis was obviously hopeless, but we decided to operate immediately I *performed a radical mastoid operation, and found* the following condition The mastoid region was remarkable for having no cells, it was very sclerosed In the antrum, which was very small and situated deeply, were a few granulations covered with pus The tegmen was soft and spongy as in acute osteomyelitis and a small sinus led into the middle fossa I removed the entire bony covering and exposed the dura There was no *extradural collection of pus*, but the membrane was thickened, inflamed, and bulging under great tension

I incised the dura, and immediately very thick and cheesy pus escaped, accompanied by blood stained cerebro spinal fluid The *amount of pus was not great*, but the type was that found in chronic abscess, some granulations were present on the inner side of the opening in the dura I carefully put a seeker through the *opening made and met with no resistance except in an upward* direction It seemed as if the entire temporal lobe was pushed away from the dura by the acute and profuse secretion of fluid following the meningeal inflammation I put two fine rubber tubes in the dural opening to act as a drain, and also exposed the lateral sinus which was quite healthy I partly closed the *original mastoid incision* and drained the antrum through the *external auditory meatus*

The patient lived about twenty four hours after the operation *without regaining consciousness*

Unfortunately I had no opportunity of making a post-mortem examination The conclusion I came to was as follows This patient had chronic suppuration in a dense acellular mastoid with a minute antrum Instead of draining, as it normally should, into the tympanic cavity and thence through a perforation in the drum (which it eventually did, but too late), it burrowed its way gradually through the tegmen and dura, forming adhesions in its course, into the temporal lobe, there forming a small chronic abscess Ultimately, for some unknown reason, an acute otitis media arose, and the pus under pressure caused a perforation of the membrana tympani, but spent most of its energy intracranially Rupture of the abscess occurred, with subsequent meningitis, which would account for the symptoms and signs present when the patient was first seen

I would add that the previous medical history of the lady was carefully inquired into and nobody had ever heard her complain of ear trouble, it was said that she always seemed very healthy and enjoyed life The appearance of the drum membrane on examination would seem to bear out this history

The case is of interest because (1) it shows that an intracranial condition may coexist with chronic mastoid disease and cause little or no symptoms, and (2) because it is in direct contrast to a case I reported in this *Journal* (October 19th, 1929, p 717), in which obvious symptoms of temporo-sphenoidal abscess were present, but operation proved the condition to be one of simple mastoiditis

TREATMENT OF BONE TUBERCULOSIS BY LARGE AMOUNTS OF VITAMINS A AND D

BY

C LEE PATTISON, M B,

MEDICAL SUPERINTENDENT, KING EDWARD VII HOSPITAL, SHEFFIELD

Our inability to arrest the spread of a tuberculous focus in bone, *until considerable destruction has occurred*, makes it worth while to investigate any therapeutic agent which seems likely to control this infection

The results of Mellanby and Green,[1] which have demonstrated the potent action of vitamin A on bacterial infection in animals and man, especially their suggestive results obtained by treating cases of puerperal sepsis[2] with preparations very rich in vitamin A, made it seem probable that the value *of cod-liver oil* as a therapeutic remedy in tuberculosis is really due to its vitamin content It appeared desirable, therefore, to see whether the exhibition of much larger doses of vitamin A than those usually given in cod-liver oil would hasten the healing process in this disease, also since bone calcification, as shown by Mellanby, is controlled by the vitamin now known as vitamin D, and since the present investigations were made on bone tuberculosis, *it was decided to increase this vitamin in the* diet as well as vitamin A, although not to such a great extent It has been mentioned in a previous communication[3] that the giving of extra amounts of vitamin D alone (in the form of irradiated ergosterol—radiostol) did not appear to increase the rapidity of recalcification of bones affected with tuberculosis to any marked extent

Two preparations of different strengths, both containing *a large quantity of vitamin A and one of them having* a high vitamin D content in addition, have been used in this investigation Both were kindly supplied by the British Drug Houses Ltd

Preparation No 1—The vitamin A of this preparation gives 150 blue *with the antimony trichloride test and has about twenty* times the vitamin A potency of cod liver oil It also contains 10,000 antirachitic units per c cm (Coward)

Preparation No 2—This has double the vitamin A content of preparation No 1 (that is, 300 blue), but only 100 antirachitic units per c cm

Forty-three patients were given large dose of these preparations as described below, while 35 patients were given 10 c cm of cod-liver oil daily These latter were intended to act as controls, and were selected because they had similar degrees of infection and bone invasion to certain patients in the other group of cases The patients included in these tests were of varying ages—from 3 to 15 years—and in both groups there were cases with early disease, with acute rapidly progressing disease, with chronic slowly increasing disease, and with disease in which recalcification of bone was commencing

Of the 43 patients, 15 were given an average dose of 7 8 c cm of preparation No 1 daily for an average period of 3 5 months, and were then given an average dose of 9 4 c cm of preparation No 2 for a further average period of 3 4 months The remaining 28 patients were given an average dose of 9 6 c cm of preparation No 2 for an average period of 4 1 months

The 35 control patients were given 10 c cm of cod-liver oil daily during the period of investigation It may be well to mention that the patients of all three groups had received cod-liver oil daily before the actual test started It will be noticed that all the patients, including the controls, got a fair supply of vitamin A and D, but that those receiving the special vitamin preparations Nos 1 and 2 had very much more vitamin A than the others

The clinical condition of the patients in the different groups and the *x*-ray appearance of their affected bones had been carefully recorded some months before the investigation, this was done again both at the commencement and at the end of the test period An examination of the accompanying table will show that of the 43 patients having the vitamin preparations 32 were improved clinically, and 11 were not, that in 25 of these 43 cases the *x* rays showed arrest of disease or increased calcification, while in 18 there

was no evidence of such improvement Of the 35 patients taking cod liver oil, 25 were clinically improved, and 10 were not The skiagram of 18 of these 35 indicated progress towards cure, while those of 17 did not

	Cases receiving much Vitamin A and D		Cases receiving moderate amounts Vitamin A and D (Cod liver Oil)	
	Number	Percentage	Number	Percentage
Total cases	43	—	35	—
Clinically improved	32	74 4	25	71.4
No clinically improved ...	11	25.6	10	28.6
Increased calcification in radiogram	25	58 1	18	51 4
No increase in calcification in radiogram	18	41 9	17	48 6

If one considers the impossibility of selecting exactly similar patients, and of estimating the exact degree of activity of disease, it will be appreciated that the patients having the concentrated vitamins and those taking cod-liver oil showed about the same amount of progress Therefore *for the types of patients described, and with the dosages* and under the other conditions mentioned, the use of preparations containing large amounts of vitamins A and D does not appear to be of more curative value than that of cod liver oil

THE TREATMENT OF ACUTE PUERPERAL INVERSION

BY

NOEL HYPHER, M R C S L R C P B Sc Lond

DRUMMOND MAXWELL stated in 1915 that "all cases of acute puerperal inversion warrant a clinical record for several reasons" Among the reasons he gave were (1) that no case had been admitted to the London Hospital for the previous fifteen years (2) the very divergent views on treatment and (3) the tendency in modern literature to invoke surgical rather than classical treatment [1]

The incidence of acute puerperal inversion is computed variously by different authors, and no two authors agree T W Eden puts the figure at one inversion in 180 000 to 200,000 labours All authors are agreed, however, that accuracy cannot be arrived at, since practically all cases occur in general practice, and general practitioners as a whole are not prone to put their cases on record

In the classical type of case the uterus is found to be inverted with the placenta centrally attached, this occurs immediately or a few minutes after the child is born In the case here reported the placenta came away fifteen minutes after delivery, but it was not till seven days later that acute inversion with prolapse occurred Fox in 1924, recorded a case where acute inversion with prolapse developed fourteen hours after delivery [2] This is the only case of some delay before the onset of acute puerperal inversion that I have come across in the literature

On May 14th I was called to a Poor Law institution to attend a primipara aged 41 who was in labour The head had been on the perineum for over an hour and in spite of good labour pains no progress was being made *Instrumental delivery under* an anaesthetic was satisfactorily accomplished and on expression of the placenta a large retro-placental clot came away A sharp post partum haemorrhage ensued and this was speedily controlled by the injection of 1 c.cm of pitorvim The placenta on examination was found to be intact with a dark area where the retro-placental clot had formed A perineal tear was sutured with three stitches and half-drachm doses of liq ext ergot were prescribed for the next few days.

The height of the uterus was charted daily by the midwives of the institution On the first day after delivery it was 7 in above the symphysis the second day 6 in the third day 5 in the fourth day 4½ in the fifth day 4 in and on the sixth day it was missing On the seventh day while the patient was using a bed pan the uterus inverted completely and prolapsed out to the vulva I arrived to find a flaccid inverted uterus about the size of a large coco-nut occupying the perineal area There had been much haemorrhage (about 2 pints) but the matron and midwife had applied towels rung out in hot water at a temperature of 120° F and the bleeding was now being kept well in check by such applications There was a moderate degree of shock and the pulse was 130

Under chloroform anaesthesia the uterus which had been well in contact with faecal matter in the bed pan was swabbed and douched with 2 per cent iodine solution at 120° F and reduction was attempted I squeezed the mass with both hands till it was reduced to the size of a foetal head blood spurting on pressure from various points but found it very difficult to force the mass through the vaginal entrance it will be recalled that the perineum had been well sutured Adopting the same methods however my colleague Dr Fraser succeeded in forcing the mass through the vaginal entrance Once this obstacle was overcome the uterus returned quite easily to its proper position So much force was employed to overcome the constriction at the introitus vaginae that the perineum was ruptured again at the original site

An intrauterine douche of 2½ pints of 2 per cent iodine at 120° F was instantly given and the haemorrhage ceased With the idea of preventing recurrence of the inversion and haemorrhage the vaginal vault was next plugged with sterile cyanide gauze well around the fornices counter-pressure being applied with an abdominal pad and binder The usual treatment for moderate shock and loss of blood followed but saline infusions were not given

On recovering from the anaesthetic the patient was definitely comfortable in contrast with her distress before the anaesthesia and reduction The temperature was 103° F and the pulse 126 but the temperature fell next day to 100° F and the cyanide gauze was removed after twenty four hours There was no haemorrhage Neither ergot nor pituitrin was ordered for fear of inducing return of the inversion Since septic endometritis was inevitable 50 c.cm of a polyvalent antistreptococcal serum was injected subcutaneously There was a moderate leucocytosis for twelve days but otherwise recovery was uneventful A subsequent vaginal examination disclosed the uterus to be situated in the normal position The patient is now very well and the perineum will be repaired in the near future

In practically all cases of acute puerperal inversion of the classical type the placenta has been found to be centrally placed and somewhat adherent The tension on the cord caused by a rapidly expelled foetus or the accoucheur has started the process of inversion and the uterus proceeds to expel itself using the placenta as a foreign body In some cases however the cord has been too long to render tension by the projected foetus a likely cause and the midwife has emphatically denied pulling on the cord It must here be assumed that the uterus after evacuating the foetus treats the centrally placed placenta as another foreign body, and promptly proceeds to expel it Crede's method of expression of the placenta, massage of the uterus, denting of the fundus when measuring the height of the uterus, and straining at evacuation, have all been blamed as causes of acute inversion

In treatment various points have to be considered Study of the cases reveals that shock and haemorrhage usually occur in inverse ratio the greater the shock the less the haemorrhage This is easily comprehensible as the blood pressure falls in proportion to the degree of shock Miles Phillip in 1911 conclusively showed that in profound shock treatment should be directed to restoring the patient before attempting to replace the uterus *Immediate replacement* of the uterus in a patient moribund from shock has only hastened the onset of death *In* three cases of profound shock Miles Phillip waited two hours, five hours and twenty hours respectively *before* attempting replacement the patients in the meanwhile being treated with saline infusions pituitary extract and morphine Hellier in 1912 returned *an inverted uterus* after four days [3] In a few cases where there was little or no shock immediate replacement was followed by recovery [4 5 6]

The importance of reduction under an anaesthetic has not been duly emphasized in the textbooks [7 8 9 10 11] in my opinion it should always be conducted under anaesthesia The process of inversion is accompanied by acute pain and sometimes shock [12] So also is the process of reduction

which may be associated with extreme collapse [2 3] Barber in 1887 described a case in which the uterus was replaced without an anaesthetic, as regards the after condition he wrote, "The general condition of the patient was most serious, she was insensible, pulseless, and the extremities cold" [12] In the three successful cases reported by Miles Phillips in 1911, anaesthesia was employed during the process of reduction Blair Bell in a recent case employed anaesthesia, even though shock was not marked [13] In my case, which was one of moderate shock, the patient was fairly comfortable after recovering from the anaesthetic Manipulations affecting the inner surface of the uterus are very painful and liable to be accompanied by shock, and it is now considered orthodox treatment to perform manual removal of an adherent placenta under anaesthesia D J Malan in 1925, while teaching students at the London Hospital, reported a case within his knowledge where the manual removal of an adherent placenta without an anaesthetic had brought about rapid death from shock It may also be recalled how frequently death from shock occurs at the hands of amateur and professional abortionists, as compared with the comparative absence of risk when therapeutic abortion is conducted under an anaesthetic [14]

In the cases where inversion has occurred with an adherent placenta, it has been found expedient to peel off the placenta before replacing the uterus In Barbour's case reduction was found to be impossible until the placenta had been removed

In 1923, E Evans had an intra-abdominal view of the process of replacement through a laparotomy wound With the patient under anaesthesia, the uterus was replaced by an assistant with a hand in the vagina He observed that restitution began from the posterior wall of the cervix [15]

The possibility of recurrence of the inversion must not be forgotten, it was in order to prevent this that we tightly plugged the vaginal vault in our case In the cases reported by Couvelaire[16] and Schockart[17] replacement was followed by return of the inversion a few hours later Schockart, after describing his case, remarks upon the necessity of plugging the uterus itself to prevent recurrence

Lastly, it would seem impossible to make a diagnostic error, but two cases are recorded of mistakes made by midwives In 1897 a midwife pulled on the inverted uterus for three-quarters of an hour thinking it to be the placenta, till the uterus, one tube and an ovary came away the other tube and ovary were congenitally absent [18] In 1915 a midwife mistook the inverted uterus for a second child, in accordance with the rules she sent for a doctor When the doctor arrived he was shown two basins, the placenta in one and the contracted uterus in the other [19] In the former case the patient recovered after closure of the peritoneal cavity, the latter patient succumbed

PERFORATION OF A SILENT DUODENAL ULCER COINCIDENT WITH PERFORATED APPENDIX

BY

D F McCARTHY, M B, D P H, L M,

SENIOR HOUSE SURGEON, GENERAL INFIRMARY, SALISBURY

THOUGH lesions of the appendix, coincident with chronic ulceration of the duodenum, are a recognized and almost a common occurrence, yet a simultaneous perforation of both is of sufficient rarity to deserve record

A mechanic aged 44 was admitted to hospital at 6 p m on May 4th as a case of "acute abdomen" The pain had started at 10 p m on May 3rd it was not rapid in onset, but came on gradually, starting in the umbilical region and spreading to the bottom of the abdomen He had vomited six or seven times, the last time being 10 a m on May 4th Vomiting relieved the pain for a time At about 12 noon there was an exacerbation of the pain Bowels open May 3rd His last meal was at supper, at 9 p m on May 3rd, which consisted of chipped potatoes with a pint of beer

The previous history was that he had had an attack of "colic" a year ago, no history of indigestion

Condition on Admission—Well nourished and healthy Expression characteristic of general peritonitis Tongue moist and furred Temperature 100 8° F, pulse 112 The abdomen moved very imperfectly on respiration It was completely rigid, and acute tenderness was present in both the iliac fossæ, especially the left and also under the left costal margin, marked hyperæsthesia Abdominal reflex lost, marked dimmution of liver dullness Rectal examination negative Chest chronic bronchitis some rhonchi present A diagnosis of perforated duodenal ulcer was made

Operation—At 8 p m Dr F L Buttar operated A right para medial incision was made, and on entering the peritoneal cavity some gas escaped, and purulent fluid was found A short search revealed a small perforation in the anterior aspect of the duodenum, about an inch from the pylorus round which some thickening was present The perforation was sutured and the fluid present was evacuated As this did not seem sufficient to account for all the symptoms present, the right iliac fossa was explored, when a perforated gangrenous appendix was found, with free pus in the abdominal cavity Appendicectomy was performed, and the wound closed with drainage The operation being completed the appendix was slit up and found to contain pus it was gangrenous for about an inch from the tip and half an inch from the tip a small perforation was present The patient suffered considerably from shock, which was successfully combated but unfortunately broncho pneumonia supervened, of which he died on May 7th

Comment

Both from the history of the case and the operative findings one is inclined to conclude that the appendix was the primary lesion I would suggest that the appendix perforated between 10 p m and 12 midnight on May 3rd, shortly after the pain began, and that the duodenal ulcer perforated at about 12 noon on May 4th, when the exacerbation of the existing pain occurred

In the literature on the subject I can find no record of a similar case, the nearest being a case, reported by Moore, of "Simultaneous suppurative appendicitis and perforated gastric ulcer" (*Lancet*, 1910) There is also one by Andre, "Appendicitis, perforated ulcer of the duodenum, subphrenic abscess" (*Clinique*, 1911) A case reported by Matheson (*British Medical Journal*, 1901) also bears a resemblance to it but in this case the girl—who was recovering from appendicitis and was seized with violent haematemesis, with symptoms of gastric perforation—was not operated on, and after death, which occurred a few hours later, no autopsy was performed, so that one can only speculate as to what condition was actually present The case reported on by Moore was that of a girl, aged 19, who had been treated medically for gastric ulceration, and who also had had previous attacks of pain in the right iliac fossa The appendix in this case, although containing pus, was not perforated

In the present case there was no history of gastric or duodenal disturbance, and no history of appendicitis It may be remarked that some oral sepsis was present, three teeth being decayed

I am indebted to Dr F L Buttar for permission to publish these notes

PAINLESS HAEMATURIA

A PLEA FOR EARLY INVESTIGATION WITH REPORT OF A CASE

BY

J. C. AINSWORTH DAVIS, M.A., M.B., B.Ch.Cantab., F.R.C.S.Eng.

The case reported below seems worthy of placing on record because mistakes of the kind mentioned are very common.

A single woman aged 54 consulted her doctor because she had noticed blood in her urine. It had come on suddenly and had lasted for forty-eight hours. There were no other symptoms whatsoever. She was placed on an alkaline diuretic mixture and assured that she had no cause for alarm. Nine months later the bleeding recurred, after which the patient was referred for investigation.

Apart from some loss of weight and the two bouts of haematuria there was nothing of interest in the history. Physical examination was negative, neither kidney being palpable or tender. The urine was clear and free from albumin and other abnormal constituents. Cystoscopic examination was normal. But on exerting firm pressure in both loins blood was seen to emerge from the left ureteric orifice. A catheter specimen *from the right kidney was normal. Indigo-carmine* injected intravenously was returned by the right kidney in three and

a half minutes and by the left in eight. Pyelography showed a normal pelvis on the right side, but definite filling defect on the left.

A diagnosis of hypernephroma was accordingly made and nephrectomy performed, all the perinephric fat removed, and the renal vessels ligatured as close to their origin as possible. *This diagnosis* was subsequently confirmed by microscopic section.

After an uneventful recovery the patient was seen at three-monthly intervals. She put on two stone in weight and apparently promised to do very well.

Fifteen months after the operation two small nodules were noticed about four inches above the lumbar incision. These were freely mobile in the subcutaneous tissues. A month later a nodule appeared over the lower part of the sternum and two others in the rectus sheath. One nodule was excised and microscopically examined. It had the typical structure of a hypernephroma. Deep x rays were applied to the nodules, but in spite of this the patient went downhill, losing weight and strength, and her end is rapidly approaching. The remains of the left kidney with the hypernephroma are shown in the accompanying illustration.

Comment

This case clearly brings out several important points.

1. Painless haematuria is a symptom of the gravest import, and calls for urological investigation without delay, *its commonest cause being* either renal or vesical growth.

2. The amount and frequency of the haematuria may bear no relation to the extent of the disease. In this case it had only occurred twice and had lasted only forty-eight hours each time, yet at least three-quarters of the kidney was replaced by growth.

3. Had there not been a delay of nine months between the first bout of bleeding and an adequate examination the patient might have been free from recurrence at the present date with a good prospect of a cure.

Memoranda:

MEDICAL, SURGICAL, OBSTETRICAL

TWO UNUSUAL CASES OF INTUSSUSCEPTION

INTUSSUSCEPTION DUE TO GUMMA

An intussusception in a boy, due to a gumma, makes the *following case worthy of record.*

A healthy boy aged 14 was admitted with a history of abdominal pain for two days prior to admission. During these two days he had two motions of the bowel, a very small quantity of faeces being passed on each occasion. He vomited for the first time three and a half hours before admission. The pain persisted and he passed frequent motions consisting entirely of blood and mucus.

On admission he was obviously in great pain. Temperature 37° C., pulse 58. The abdomen was not rigid; there was a definite, very tender mass in the lower segment of the abdomen. A rectal examination confirmed the presence of this tender mass. There was mucus and blood only on the examining finger, and the subsequent motions consisted of mucus and blood only. The tongue was dirty.

An acute intussusception was diagnosed, and laparotomy revealed an intussusception of the type ileo-ileal becoming ileo-colic. After reduction a mass could be felt through the intestinal wall in that part of the ileum close to the ileo-caecal valve, the mass being part of the bowel wall. To prevent recurrence the terminal portion of the ileum together with the caecum was excised and end-to-end anastomosis performed. The boy made an uninterrupted recovery.

The tumour on examination proved to be a typical gumma. A Wassermann test was negative both before and after a provocative dose of kharsulphan.

EVELEEN LYLES, M.B.Lond.

Booth Hall Hospital, Manchester, E.

INTUSSUSCEPTION OF THE APPENDIX

A boy aged 12, was admitted as a straightforward case of acute appendicitis of eighteen hours' duration. At operation the appendix was found to be acutely inflamed and the site of an intussusception, the tip having invaginated itself almost to the base of the *appendix. Recovery was uneventful.*

FLORENCE WHITROW, M.B.Manch.

Booth Hall Hospital, Manchester, E.

Thanks are due to Dr. J. D. Ewart, medical superintendent, Booth Hall Hospital for Children, Manchester, and to Mr. E. E. Hughes, the visiting surgeon, for permission to publish these cases, and also to Dr. G. Dawson for the pathological investigation.

A SERIES OF GASTRIC PERFORATIONS

In view of the fact that acute perforation of the stomach is not very common in malignant disease of that organ and acute gastric perforation in a patient living in bed and under medical treatment must be very rare, the following cases may be of interest.

A man aged 46 was admitted to the Royal Albert Hospital, Devonport, on March 5th, 1930, with all the signs and symptoms of acute gastric perforation. He was at work when the attack occurred, and there was a history of indigestion for fifteen years.

At operation a perforation about a quarter of an inch in diameter was found on the lesser curvature near the pylorus. *This was closed with difficulty on account of the friability* of the edges, and an omental graft was placed over the perforation. The remainder of the stomach and duodenum appeared normal. A drainage tube was inserted down to the pelvis through a separate stab wound, the main incision being completely closed. The operation only took thirteen minutes.

The patient appeared quite well the next day, and on the second day was sitting up in bed playing cards with some of the other patients. Forty-eight hours after operation fluid was given by the mouth, and the patient was put on extra-ed milk in gradually increasing doses up to 6 oz. every two hours, followed by ten days with pulv. alk. (McLean). He did perfectly well, temperature, pulse, etc. He suddenly collapsed and had subnormal temperature, rapid pulse, etc. He complained of no pain and nothing abnormal was found on examination. A large haemorrhage was thought to be the cause, and the usual measures adopted for this. Next day he passed some altered blood in his motions. Recovery began and went on perfectly well for a further ten days, when another collapse similar to the previous one occurred. Again the patient did not complain of anything but weakness and nothing abnormal

found on abdominal examination This time he did not rally, but died five days later

At the post-mortem examination a recently perforated gastric ulcer was found on the lesser curvature, near the cardiac end Gastric contents were present in the peritoneal cavity, and there was some lymph covering the peritoneum This lesion had evidently been the cause of death The original perforation was soundly sealed over by omentum, but proximal to this another perforation had occurred, which was also sealed by omentum This one evidently accounted for his first collapse after operation There were some enlarged glands around the coeliac axis, but no secondary nodules in the liver The stomach wall appeared thicker than usual, but the mucous membrane seemed normal The pathological report was diffuse colloid carcinoma of the stomach

I am indebted to Mr G I Preston surgeon in charge of the case and Dr E Wordley the pathologist, for permission to publish these notes

ROBERT REYNOLDS, M D , B Ch ,

BILATERAL RANULA IN THE NEWBORN

THIS condition must be comparatively rare I can find little mention of it in the literature I have had a case recently The swellings were of the size of small hen's eggs, and pushed up the tongue to the roof of the mouth so completely that it was impossible for the child to suck I aspirated each side in turn and obtained from each some 20 c cm of dirty-looking fluid, resembling that obtained from old hydroceles The sacs partly refilled after a few days I incised them (obtaining from them on this occasion glairy, clear material), scraped the interiors with a sharp spoon, and packed them with gauze ribbon steeped in iodine, removing the ribbon after a few minutes The procedure has apparently been successful in obliterating the sacs as the swellings have quite disappeared, and the child is able to feed normally It still, however, has a habit of keeping the tip of the tongue against the roof of the mouth

Reviews.

A SYNOPSIS OF HYGIENE

THE appearance of the third edition of Professor W W JAMESON'S *Synopsis of Hygiene*[1]—on this occasion with the collaboration of Lieut.-Colonel G S PARKINSON—is a sure index of the high estimation in which this well-known work is held Its modest claim to be a synopsis is more than justified It covers the field, is clear throughout, and observes an excellent sense of proportion in adjusting the space required to be allotted to the rival topics now included within the scope of the D P H examinations Moreover, although synoptic in substance, it is not too synoptic in style, but very readable

The opening section on meteorology is well informed and up to date The millibar notation, still a mystery to many, is duly explained In the section on water there is a good conspectus of the geology of water-bearing formations and an adequate account of present-day methods of water purification In the considerable section on food the subject of meat is well summarized, the important points in food poisoning are made plain, and the canning of food and the use of preservatives are discussed in a competent and interesting manner The article on vitamins which has been rewritten to include the results of recent investigations, is lucid and well balanced The tion on vital statistics is clear and suitably presented, the article on statistical methods, though clear to the ited may seem unduly compressed to others The tion dealing with sanitary law contains an excellent view of English local government, including the central and local authorities, and public health officers and their duties The Local Government Act, 1929, is properly set forth together with the Milk Acts and Orders, the Meat Regulations, and other current instruments of administration The work concludes with a useful compendium of public health chemistry and physics

A special merit of the book is its abundance of references to official and other sources, and its copious citations of works for further study It is described on the title page as specially intended for those studying for a diploma in public health To all such it may be cordially recommended

"CRIPLE FOLK"

Civilization and the Cripple[1] is an interesting and instructive book its author, Mr FREDERICK WATSON, has strong claims upon our attention He founded and edited the international quarterly journal called *The Cripple* for five years or more As a county director of the British Red Cross Society and chairman of the Montgomeryshire Voluntary Orthopaedic Association, he is qualified to speak on questions of organization, while he has had experience of the problems of rehabilitation as a deputy controller in the Appointments Department of the Ministry of Labour during the period of demobilization after the armistice He uses the term "cripple" in its widest sense, including under it the injured in industrial and other accidents as well as the adolescent and adult victims of disease

There is a great deal that is of interest in the book but to our mind the most attractive chapter is that on the American scheme, in which Mr Watson describes in considerable detail the methods of investigation and of relief and cure which have been elaborated in the United States, mainly since the war, forming a scheme of civilian rehabilitation which developed out of the rehabilitation of disabled soldiers The Federal Boards estimate the number of accident cases needing vocational training or restoration at 80,000 a year, let alone cripples from disease Most extensive and praiseworthy efforts have been made to re-educate and rehabilitate these patients, with very considerable success, but one may still wonder if such efforts can really succeed in a country which has, according to Mr Watson, 5 million workpeople out of employment It may be questioned whether it is worth while to train a cripple for a job for which there are already several able-bodied candidates Setting such doubts on one side, the reader will find the American scheme worth study It aims at covering the industrial or transport case from the moment of accident, through psychological, medical, and educative stages It has often been found in this country that a psychological cure is only possible when the patient's doubts are ended by a final award, leaving him no inducement to exaggerate his inability Mr Watson tells us, on the other hand, that "the Americans are fully alive to the futility of cash payments for injuries It is realized that cash should be used in order that the injured man may be trained for another job, not as a solace for his injuries" There seems no reason to doubt that in some at least of the United States re-education of the industrial cripple has been very successful, and that those who through its means have found new jobs have been able to keep them According to one investigator this success was attributable to four causes—namely, (1) complete physical restoration, (2) better training of the disabled than of the ordinary workman, (3) excess of demand for such men over the supply, and (4) supervision of the ex-devant cripple until he is permanently settled in his job In this connexion it is worthy of notice that Mr Henry Ford employs in his motor works 8,000 cripples, of whom some are blind

Turning from crippling by accident to crippling by disease, Mr Watson gives us an interesting chapter on prevention and rehabilitation, in which we are glad to find strong support and a plea for extension of the successful work of Dr Varrier-Jones at Papworth, even though the subject of pulmonary tubercle is rather beyond the scope of the care of cripples, unless a new and enlarged definition of "cripple" is accepted In the same chapter the author emphasizes the baleful role played by alcohol in the etiology

[1] *Civilization and the Cripple* By Frederick Watson London J Bale, Sons and Danielsson, Ltd 1930 (Sup roy 8vo pp viii + 120 illustrated 10s 6d net)

of tuberculous disease and the close relationship between defective housing and ill health Improved housing conditions, however, are not enough alone The social position of the slum dweller must be improved till he loses the slum mind and is made fit for more healthy surroundings The explorer of some of the latest rehousing schemes and colonies, such as Becontree, will find how quickly and completely the slum dweller can reproduce a slum in even the best planned and most up to-date buildings of the most progressive and enlightened county council

HUMAN EMBRYOLOGY

The Essentials of Human Embryology [1] by Professor DODDS of West Virginia University, is the last of an imposing series of textbooks on this subject from the other side of the Atlantic As not infrequently happens in such circumstances it is one of the best the author having had at his disposal the work of his predecessors and indeed the work under review offers little ground for criticism either from the point of view of accuracy or arrangement The book is primarily intended for medical students and special attention is therefore paid to such sections of the subject as the circulatory and genito-urinary systems where anomalies are apt to occur Certain sections on the other hand, are somewhat summarily dismissed No mention for example is made of the velum interpositum in the account of the development of the central nervous system, and very little is said of the development of the cerebellum To say again that the olfactory bulb appears on the ventral aspect of the cerebral hemisphere betrays an entirely wrong conception of the fundamental fact that it is the hemisphere which is grafted on the bulb We should have liked also to see a somewhat more adequate explanation of the development of the ocular muscles, claiming as they do for their innervation no fewer than three cranial nerves

A special feature of the work is furnished by the illustrations which are both numerous and good though some of the diagrams fail in our opinion to render that service of simplification for which they were apparently designed This failure is most apparent in the section dealing with the subdivision of the coelom—admittedly a difficult subject in the absence of models Despite these drawbacks the book can be warmly recommended as giving students all the information they are likely to require in the course of their medical curriculum

BLOOD DISEASES

In spite of the plethora of haematological literature clinicians will certainly welcome *Diseases of the Blood* [2] by P W CLOUGH Essentially a book for the practitioner it gives in a simple and clear manner a comprehensive description of most of those so-called diseases of the blood which are liable to be met with in general medical practice The thorough sifting of differential diagnosis has led, perhaps inevitably, to some repetition and overlapping, especially in the extensive account of pernicious anaemia and leukaemia, but this may serve to impress the memory and whereas disputed questions are treated on the whole with impartial consideration and frank acknowledgement of ignorance, the prevailing tone is usefully dogmatic and practical Pure haematology and technique occupy a comparatively small section of the book The description and phylogeresis of the blood cells is well and sufficiently dealt with The author is rather indefinite about the nature of reticulocytes, he does not appear to recognize that polychromatic red cells and stippled red cells are identical with *reticulocytes* With regard to technique it would have been an advantage to have had some choice and some accounts of the more commonly employed methods In this country Haldane's *method* for the estimation of haemoglobin is the best known, in the enumeration of red cells Hayem's solution is not much used as a diluting fluid in this connexion the author makes no mention of a common source of error caused by contact haemolysis Red cell and white cell counts are usually made from the same drop the employment of white cell pipettes and special diluting fluid has been now largely discarded In the practice of most clinical laboratories microscope slides and not cover slips are used for preparing blood films It is a pity that the formula of Wilson's stain is not given presumably this is some variant of Romanowsky's stain The staining and enumeration of blood platelets is not dealt with as fully as might be desired English readers will find some of the American expressions tiresome but it is a most excellent book and both the author and publisher are to be congratulated on the production of such a handy yet comprehensive volume at the modest price of 6s

PROPHYLAXIS AGAINST PEDANTRY

THE first edition of Professor RAYMOND PEARL'S prophylactic chapters against pedantry published under the title of *To Begin With*, [3] has already been reviewed in these pages It is therefore unnecessary to dwell on his underlying argument that a specialist should know something about matters outside his laboratory or to assent or dissent — always with profit — while considering the directed reading" he advises with such an agreeable mockery of all those who yield to the 'psychopathic" craving for giving this special kind of advice A biologist who quotes from Chinese emperors Horace the Rev Dr Opimian Petronius and Duhamel, within a page or two who is determined that his students should learn what science is in a philosophic and human sense and that they should never forget that the business of living is the prime affair even for a scientist who begins his course of reading with Lucretius, declares that everybody who calls himself a man ought to have read such a Platonic dialogue as *The Apology* " recommend Rabelais Voltaire and Flaubert's much abused *Bouvard et Pecuchet* among more technical volumes as works necessary to the underpinning" of a scientific mind Baltasar Gracian's *Art of Worldly Wisdom* Balzac's *Physiologie du Mariage* Warner Allen's *Wines of France* the Bergeret series of Anatole France and J B Cabell's *Straus and Prayer-books* as helpful manuals for daily existence is a salutory person to be director of an institute for biological research His zest is so keen that one hesitates to disagree with him even when in one of his side flashes he ranks Shaw and Mencken with Voltaire and Swift This spirited modernism is probably all to the good in his particular cause His sceptical intelligence has its limitations however and the books he throws at the student in the epilogue for their religious education" are really not good enough Mysticism is apparently not to his taste but it is a biological and sociological phenomenon *The Confessions of St Augustine* would add to his directed course' something he has omitted

The 'revision and enlargement' of the volume consist of a new preface and an additional chapter The rest of the book is unaltered, for, as Professor Pearl sensibly says 'Warmed over food always lacks its savour The new preface pretends to lament the sad case of a charming young lady who, about to sit for her final examination for a doctorate in philosophy read *To Begin With* and refused to proceed, stricken with the conviction that he had no intellectual background The new chapter "Annotations is composed of observations in criticism applied to his choice of books In discussing [illegible] nomical books Professor Pearl [illegible] not instinctively [illegible] advice about good [illegible] in claiming better [illegible] destroyed by savage [illegible] is very amusing and [illegible] armed in the literatur

deadliest to pedantry Some of the volumes recommended are a little out of date, and some have perhaps not yet received European recognition, but these are minor points that do not impair the potency of his astringent prophylaxis

DIFFERENTIAL DIAGNOSIS OF INTRA-ABDOMINAL CONCRETIONS

In his brief but generously illustrated monograph, *Radiographie nephro-cholecystique*,[6] DR DE ABREU of Rio who has written a larger work on the radiological diagnosis of pulmonary and mediastinal conditions, considers the differential diagnosis of renal, gall-bladder, and other intra-abdominal concretions, and proposes a new radiological technique which he has employed for at least five years This method of diagnosis is derived from the principle set out in the above-mentioned work on the radiology of the lungs and mediastinum, and largely depends on the different radiological appearances given by the kidney and its surrounding fat Instead of relying on a lateral view of the kidney, which is submitted to serious criticism, a combination of antero posterior and oblique posterior views of that organ is used to bring out with much better definition the opaque kidney and the transparent fatty tissue around it By combining this method with pyelography and cholecystography renal calculi can be differentiated from gall-bladder and bile-duct calculi and calcified costal cartilages The author strongly advocates the Trendelenburg position during pyelography by the oblique posterior view

NOTES ON BOOKS

IN this study of *Instinct and Intuition* MR BINNEY DIBBLEE has undoubtedly made an original contribution to psychology He bases his argument on the thesis that the thalamus and the cortex must be taken as the high level developments, both structurally and functionally of two divisions of the nervous system, phylogenetically distinct and in large measure antithetical Psychologically he contrasts "instinct," which in man he reckons as a "faculty" by no means comparable to the separate instincts of animals, with intuition and intelligence He regards the latter two functions as to a certain extent complementary intuition working extraconsciously and having at its command a vast store of memories while intelligence exerts rational control in consciousness" He bases his physiological conclusions on the work of Head and Parsons and lays great stress on the importance of the mesial nucleus and interealated cells To the cortex he attributes the functions of intuition and intelligence, but does not work this out in such detail as for the thalamic function He considers that dualities such as pleasure and pain thought and feeling conscious and unconscious which have been discussed at great length in psychological literature, are not fundamental, since they do not depend on the physiologically antithetic organs—the thalamus and the cortex If MR DIBBLEE is sometimes a little obscure in his argument, his main thesis is one of great interest which will compel thought, and it is to be hoped further research will be undertaken to clarify the important debatable ground that lies at the junction of physiology and psychology

The popularity of the Strumpell Seyfarth Textbook of Special Pathology and Therapeutics[7] is shown by the fact that a new edition has been called for within a year from the appearance of the last, of which a review was recently published in these columns The first volume of the new twenty ninth and thirtieth edition is devoted to the consideration of acute infectious disease prevalent in temperate and tropical climates and diseases of the respiratory, circulatory, and digestive systems Some new illustrations have been added, and the work as a whole has been well brought up to date, but we miss any mention of paratyphoid C, tropical typhus, the prodromal rashes of measles or the nervous sequels of vaccination, which as Eckstein has recently shown are by no means unknown in Germany, nor can we agree with the recommendation that every scarlet fever patient should be kept six weeks in bed to prevent the occurrence of nephritis

The little work on Esperanto,[8] by MR BERNARD LONG, president of the Esperanto Congress held in Oxford this year, comprises, as its subtitle states a discussion of the language problem and its solution The origin, spread, and practical use of Esperanto are described, especially in relation to travel, science, commerce, literature, and education The medical interest of this international language lies not only in the fact that it was created by DR L L ZAMENHOF, a Polish ophthalmologist who died in 1917 at the age of 58, but also in the suggestion made by MR LONG that Esperanto might be used with advantage at medical as at other international congresses

THE DEVELOPMENT OF MATERNITY WORK IN CHINA

ONE of the crying needs of the great Republic of China has been a thorough reform of her maternity system Midwives have been a part of the social economy for years the commencement of a system of midwifery stretching back into the dim past But one of the features of many of the old midwifery books is their scarcely veiled contempt for the midwife in being as is shown by the following quotation from one of them, *Ta Sheng P'ien* (circa 1600)

"Now we come to the necessity of having a midwife Sometimes we have to use them but as the majority of them are fools and know little about obstetrics one must take responsibility oneself and not follow all the orders given by the midwife When they come to a house they ask the patient to bear down in labour at once, and say the child's head is just above the perineum and rub the abdomen and back, paying no attention to the stage of labour Sometimes they rupture the membranes artificially and this method may do much harm to the patient In a word they do their best to exhibit their skill The worst class of midwives charge an extra fee for a delivery Rich families have their own private midwives, and sometimes a family will have more than one, each of them has her own method and between them they turn the house into a market"

This is no fancy picture that has been painted A Chinese lady of good family, addressing a meeting where new ways were being advocated, stated that she herself, when in labour, had to get up and go round serving tea to the midwives before they would help her Most of these midwives know nothing of the science of midwifery, as for cleanliness, there is a deformed midwife known to me who scrambles about on her hands and knees, and has been seen to raise herself from this position, wipe her hands down her clothes and then proceed to make a vaginal examination Little wonder that the maternal mortality in childbirth amounts to approximately 15 per 1,000, while we look upon a mortality of 3 per 1,000 as too high, the neo-natal mortality is at least 250 per 1,000, while our neo-natal mortality is below 75 per 1,000 I know of one village where 70 per cent of the children born died of tetanus neonatorum, and all over the Republic this easily preventable disaster carries off its thousands

For years the burden of this need has been on the hearts of all medical workers, Chinese and foreign, and in connexion with some of the medical mission hospitals a beginning was made in training midwives Then sporadic attempts were made by local authorities to control and register midwives, and in places such as Nanking and Canton a beginning was made, which, however, was only a flash in the pan But of late there has been a real attempt to grapple with the matter, and under the aegis of the Nationalist Government a board has been formed, responsible to the Ministries of Health and Education, this has drawn up plans and regulations for schools for midwives The first National School for Midwifery Training has been already opened at Peiping (Peking), with a

trained staff under the control of Dr Marion Yang who has summed up the general situation as follows

Economic conditions in China and the small number of applicants make it impossible to train the number of personnel required for the country in less than half a century Meanwhile in order to meet the present demands as many suitable training and refresher courses as possible should be established with certification of successful candidates In the meantime the community has to utilize what is obtainable and the medical administrative authorities have to make use of what exists Since the establishment of the Ministry of Health midwifery control has come directly under its jurisdiction The enforcement of the regulations largely depends upon how the local health authorities act It seems that the normal procedure would be the registration of the present practising midwives, both old type and modern trained

FIG 1.—A classroom in the First National Midwifery School.

It is estimated that there are 200 000 old type and 500 modern trained midwives in China To make registration possible one will have to lower the requirements to include all the former groups, and even then about one third of the deliveries will be done by helpers who do not practise as a profession One will have to be content under present conditions to register about 85 per cent of those acting as midwives Most of these depend upon their profession as a means of livelihood in which case there exists little difficulty in requesting them to register Registration however at times is impossible to obtain, since some midwives realizing their poor qualification and lack of training refuse to register, and as yet there is no power to compel them Also those who take midwifery work merely as a kind of voluntary service will not register With an incomplete registration it is very difficult to enforce rules governing their practice and with unregistered midwives practising secretly we cannot expect 100 per cent perfection

China's present high maternal and infant mortality rate as compared with other countries is most deplorable The principal causes of this mortality are puerperal infection and tetanus neonatorum Thus the urgent need for midwifery training has come to the attention of the Government As a preliminary step and in order to meet the most pressing need, steps had been taken locally by the Peiping Midwifery Commission to train somewhat the old type midwives who were practising without the slightest knowledge of the theory of their profession During last year 163 old type midwives in Peiping have been trained especially as to cleanliness, in order to diminish the mortality caused by puerperal infection and tetanus neonatorum Those who after this training passed the examination have been given baskets and are being allowed to continue their profession It has been found to be an excellent measure to utilize these old type midwives as a means of publicity their talk and demonstration influencing the mass of the people more than anything else Furthermore it gives the community a chance of recognizing the need and value of modern midwifery, thus creating a demand for modern trained midwives

Supervisors are being engaged to observe whether these midwives are carrying on their profession on a satisfactory basis, to encourage them in case of difficulties to gain the patients confidence and to learn the reaction of the class to the new effort The supervisor also has opportunity of learning about the standards of living of the patients visited and to raise public opinion tending towards the improvement of the midwifery profession in preparation for full control

The present objects of the school are threefold (1) to give a thorough two years training to women who have had a good general education in order that they may become teachers in provincial schools, (2) to give a six months' midwifery training to women who have had a fair general education (this being regarded as a provincial matter) and to supply the immediate crying need and (3) to gather in, register and give elementary training to the midwives of the city It is estimated that in Peiping there are 270 old-type midwives and 35 who have had training in modern method 220 of this number are in active practice Of these old midwives, as has been already said, no fewer than 163 have been brought in and given this elementary course In the old days there was a loose kind of registration with the police, but a proper register is being formed, 193 of the 220 mentioned above are already registered, and the beginnings of a disciplinary system are on foot

There is an increasing demand among women for maternity training and a number of students are already enrolled, ten in each class A small maternity hospital is being enlarged, and there is every prospect of the movement becoming a real factor in the life of the people Perhaps one of the most promising things is the way in which the work has progressed in spite of political upsets and occasional setbacks, there are signs that similar movements will before long occur in all the provincial capital

There are two women doctors attached to the staff both being graduates of the Union Medical College for Women at Peking The director, Miss Marion Yang, and the dean,

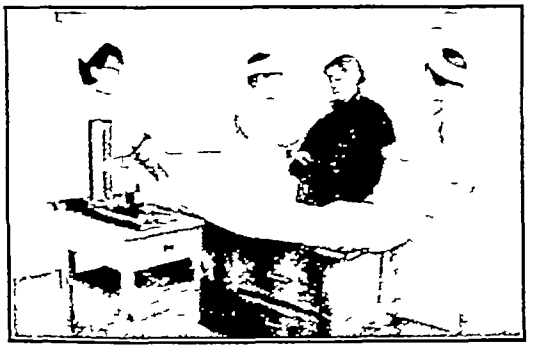

FIG 2.—The ante natal examination room.

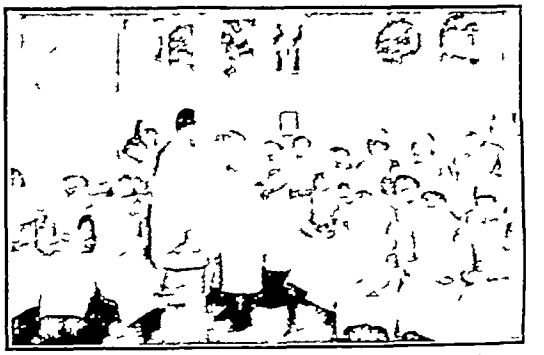

FIG 3.—Pupil midwives being inoculated against typhoid fever

Miss Lily Tseng a fully trained nurse have had the opportunity of post-graduate study abroad the former in both America and England the dean holds the C M B diploma and was trained at the British Hospital for Mothers and Babies Woolwich Both of the doctors have been members of the resident staff of the obstetrical department of the Peiping Union Medical College and the director is still on the visiting staff as a voluntary member taking charge of the out patient department

To sum up, a real beginning of a modern board for China has been made There is no doubt that the work will steadily progress in spite of political changes and parties being agreed on the necessity for such development

THE SCANDAL OF THE REFUSE DUMPS

On July 16th, as reported in our last issue (p 156), Miss Susan Lawrence, Parliamentary Secretary to the Ministry of Health, received a deputation representing the Essex riverside local authorities affected by the dumping of refuse from the Greater London area, and in reply to their representations said she would make no attempt to minimize the gravity of the present state of affairs She had herself been over one of these dumps, and their existence seemed to her a public scandal

It is some years since the London County Council first called the attention of the Minister of Health to this scandal, and from time to time Members of Parliament interested in questions affecting the public health have insistently urged upon the Minister that effective steps should be taken to stop the unseemly practice of dumping the scourings of the streets, the refuse from domestic buildings, and the decomposing and offensive dejecta of trade and industry in gigantic heaps on sites in the neighbourhood of London These sites, still in use and originally adopted as convenient for this unsavoury practice, have now perforce become the residential areas of the overflowing population of the metropolis All that the London County Council had alleged was more than confirmed as a result of the Minister's inquiries A report made by Mr C J Dawes,[1] the Inspector of Public Cleansing of the Ministry of Health, who had been appointed to investigate the whole question, revealed a state of affairs that was simply shocking The report received a large measure of public attention, gross and outrageous evils were described and depicted in the press It was clear that something must be done to remedy evils officially described in the strongest terms But, as the report pointed out, and as must have been already recognized by the London County Council in its appeal to the Ministry, there was no remedy under the existing machinery No single administrative authority was to blame, and no local authority, either alone or in any conceivable practicable co-operation with other authorities, could stop it It was a sanitary problem of Greater London which none of its parts, great or small, could effectively deal with But Greater London, while a vast unit, has no corporate existence In this and other health problems which are those of the whole civic community there is no city corporation as in other large cities, exercising authority over the whole It is true that every now and then when obsolete machinery cracks because of a strain it was never devised to bear, an *ad hoc* authority, such as the Water Board, an electricity, or transport board, is created or suggested And in the absence of any other London precedent, this was what Mr Dawes was compelled to suggest as the only practicable way of dealing with an increasing danger to health

It is certain that *some* authority exercising jurisdiction over the whole of Greater London is alone competent to deal effectively with this grave situation That apparently was the view taken by the then Minister, Mr Neville Chamberlain, who, upon considering the report by Mr Dawes, appointed a Departmental Committee on London Cleansing The terms of reference to the committee are significant "I hereby appoint to be a committee to consider the report made by Mr C J Dawes on public cleansing in London, and to recommend what measures should be taken on the report

The committee will consider at an appropriate stage of their proceedings whether it is advisable that there should be added to the committee persons representative of the interests of local authorities in the neighbourhood of the Administrative County of London" In the report of the departmental committee, which has now been issued,[2] there occurs the following passage "We may here explain that it was decided at our first meeting that the subject we had to consider was London's own special problem, and that for the time being at any rate it was not desirable that the committee should be enlarged so as to include representatives of extra-metropolitan authorities We saw no reason later to alter this view" London, for the departmental committee, means the administrative county The committee finds that it is no longer practicable for the twenty-nine metropolitan sanitary authorities within the administrative county of London separately to dispose of their refuse efficiently, and so it suggests the formation of a central body representative of the said twenty-nine authorities which in some vague way is to co-ordinate the public cleansing service of London It does not seem to have occurred to the departmental committee that the problem before it was a health and administrative problem of that Greater London of which the administrative county forms but a part

The larger part of the population of the metropolis lives outside the limits of the administrative county the aggrieved element in that population lives beyond the county's border, the metropolitan boroughs, though perhaps the chief, are by no means the sole offenders in producing the grave nuisances for which the committee was appointed to find an effective remedy Concerned at the inefficiency and mismanagement of the public cleansing services of the metropolitan boroughs exposed by Mr Dawes, the committee concentrated on these defects, oblivious of the wider bearings of its reference "We are unanimously of opinion, after what we have seen and heard for ourselves, that the facts as to the conditions in the public cleansing service of London have been fairly and accurately presented in his [Mr Dawes's] report, and have not been controverted by any of the evidence that has been submitted to us" But it was not alone the shortcomings of the metropolitan boroughs, as the cleansing authorities within the administrative county, that led Mr Dawes to suggest the formation of an *ad hoc* authority for public cleansing in London It was mainly—as we should infer—because he knew that the scandal of the gigantic muck heaps dumped in the residential areas of outer London could be dealt with only by an authority exercising jurisdiction for the purpose in question over the whole of Greater London For the departmental committee to have missed this point deprives its report of any value as a contribution to the solution of the problem It is not that the committee was unimpressed with the dreadful state of affairs "We have inspected most of the refuse disposal works in London, and are agreed that generally they are out of date, insanitary, inefficient, or so situated as to cause nuisance or grave annoyance As regards the dumping of refuse in areas outside London we have received evidence, written or oral, or

[1] See *British Medical Journal*, April 26th, 1929 p 734

[2] Cmd 3613 Report of the Departmental Committee on London Cleansing London H M Stationery Office 1930 6d

both from the county councils of Essex, Hertfordshire and Middlesex from most of the firms engaged in the transport and disposal of refuse, and from other authorities and bodies we are emphatically of opinion, as the result of our inspections and the evidence submitted that the system of dumping crude refuse without taking adequate precautions to prevent nuisance arising should not be allowed to continue As if any precautions could be adequate and practicable having regard to the scale on which London refuse is dumped! And so we are not surprised to learn that the committee is of opinion that county councils or local authorities should not be given power to exclude refuse from districts other than that in which it is proposed to be deposited or to exercise a veto over sites proposed to be used for tipping refuse The mass of corruption pouring out of London into surrounding area in process of rapid development is an offence, but those afflicted by it must not be given power to exclude the filth

The creation of a central authority competent to deal effectively with the question raises many difficulties Although the committee was agreed as to the necessity for a central service controlled by one authority or body for the disposal of the whole of the house trade and street refuse of the administrative county of London, it had not (as Miss Lawrence pointed out) been able to agree as to the constitution of the central authority and made no recommendations on this vital matter And so nothing that can be effective is to be done *The heaps will go on growing, futile* placebos will be palmed off on the offended public whenever it becomes restive Flies and rats and septic dust, smoke and stinks will continue to pervade the vicinity of the new housing estates on which millions of pounds are being spent to provide the people with healthier homes No one has the courage to tackle the tremendous issues raised by this and other health questions peculiar to the unwieldy community of Greater London The difficulties of the Minister of Health have not been lessened nor his responsibility diminished by the failure of the committee appointed by his predecessor to find a remedy for the evils complained of The insistent urgency of their removal has been confirmed and on the Minister's shoulders now lies the task of dealing with the situation

CHROMOSOMES IN MAN

Ever since the evidence was presented that the chromosomes are, in all probability, the carriers of the hereditary factors, and are an essential part in the sex determining mechanism it has become a matter of some considerable interest, not to say importance, that the number and the character of the chromosomes in man should be determined As far back as 1912 Winiwarter published his observation that the diploid number of the male was 47, that of the female 48 From this it seemed to follow that male was to be distinguished from female in the human species by the possession of a single unpaired X chromosome Other papers dealing with the same subject followed in rapid succession, but without exception they seemed to indicate that Winiwarter was wrong, and that a diploid number of 24 was the correct count

At this point there appeared three papers—two from Japan and one from America—which confirmed Winiwarter's conclusions though they differed amongst themselves on the question whether in the male there were 47 or 48 Oguma and Kihara reported 47 chromosomes in spermatogonia, whereas Painter reported 48 of which 2 were an XY pair The discussion was somewhat complicated by the fact that the Japanese dealt with Japanese material while the American dealt with American white and negro Later Winiwarter and Oguma published a second paper in which their earlier conclusion that the male has a single unpaired X was reaffirmed

Evans and Swezy in their recent monograph on *The Chromosomes in Man, Sex and Spermatogenesis*[1] tackle the question by an extensive study of human spermatogenesis It differs from the former studies by its much more extensive and comprehensive presentation of indubitable evidence for the existence of an XY combination in the human male and clearly demonstrate the fact that the diploid number in both male and female is 48 The material is obtained from white negro Mexican and Indian and in addition chromosome counts were made on the tissues from two embryos from the ovaries of a young girl, and also from fragments of testes removed taken from the body of a middle aged man They demonstrated beyond all doubt that in spermatogonia there are 48 chromosomes and that in the primary spermatocyte the reduced number is 24 as it is also in the secondary spermatocyte They find that the X chromosome is the smallest element in the whole chromosome content and that its recognition is made easy because of its characteristic small size In the primary spermatocyte the X and the Y are paired and the segregate during this particular division Among the secondary spermatocytes there are two kinds Some contain a small X in their this particular chromosome is although the total number of chromosomes is 24 It follows from this that the mature spermatozoa are two kinds—one which carries the Y the other which carries the X Their evidence confirms the conclusion that in the human subject the male is the digametic sex It can now be accepted without question that the diploid number of chromosomes in man is 48 and the haploid 24 and that the male is XY Furthermore it is established that the sexes can be distinguished by difference in chromosome content

A B.M.A. ODYSSEY

On July 27th, 1929 Sir Ewen Maclean signalized the end of his Presidential year by starting on a journey round the world as official delegate of the British Medical Association to many of its Branches in distant parts After his return he gave some account of this tour to the members of the Council, who were delighted to hear of the splendid welcome given him at every halting place and to receive first-hand news, from the lips of an acute observer, of the strength and enthusiasm and loyalty of the Association overseas Sir Ewen has now written the story and had it printed to please his many friends abroad and at home He calls it aptly 'A B M A Odyssey Round the World in 140 days.' The narrative goes with a swing, the printing and general get-up are worthy of Tanner and Butler's press and many of the seventy pages of the pamphlet are adorned with cheerful pictures mainly of Australian scenes The concluding paragraph may well be quoted here It has been a very privileged ex[illegible] It has abundantly added to my knowl[illegible] wonderful world it has given me [illegible] believe will be enduring [illegible] pioneer work it has [illegible]

membership of this great Association, it has more than ever impressed me with the importance of our Overseas Branches, and it has convinced me of the obligation which rests with us, personally and corporately, to prove ourselves worthy of that great heritage."

TUBERCULOSIS MORTALITY IN CHILDREN

THE fall in the mortality rates from tuberculosis that has taken place during the past thirty years in this country has been greater in children under the age of 5 than in any other age group. Drs. D. J. Dow and W. E. Lloyd of the Brompton Hospital, who have conducted a statistical investigation on tuberculosis mortality in children, point out in their report[1] that, although the absolute rate of mortality from tuberculosis is greater in infants than in older children, relatively to the rate of mortality from all causes it is lower in young children than in those approaching adult life. A study of the annual death rates from tuberculosis per million persons living shows that from 1901 to 1910 the heaviest mortality was in children under 5, the rate then being nearly 3,000 per million living at that age. In 1914 the mortality of this group from tuberculosis—till then higher than that of any other 5-year group—had taken second place to that of the 40-45-year group, and since then it has always been lower than that prevailing in several other periods of life. Analysing the tuberculosis mortality figures for England and Wales from 1898 to 1927 in children under the age of 15, the authors of the report show that during this period the death rate from tuberculosis in children under 1 year of age decreased by 86 per cent., the fall between 1898 and 1912 having taken place rapidly and almost without interruption, and a similar fall having occurred since 1917. The fall in the higher age groups, though not so big, is striking enough, thus in children between 1 and 5 years of age it is 67 per cent., in children between 5 and 10 it is 47 per cent., and in children between 10 and 16 it is 35 per cent. It is interesting to compare these figures with the fall in the rates of mortality from all causes during the same period. In children under 1 year the fall is 56 per cent., in children between 1 and 5, 58 per cent., in children between 5 and 10, 39 per cent., and in children between 10 and 15, 31·8 per cent. A study of the mortality rate from tuberculosis in each of these age groups expressed as a percentage of the total mortality from tuberculosis among children under 15 shows that only in the group of children under 1 year has this figure fallen between the years 1898 and 1927, in the later groups it has increased. Carrying their analysis into the mortality from different types of tuberculosis, the authors found that during the period under survey the death rate from abdominal tuberculosis has fallen by 89 per cent., from tuberculous meningitis by 62 per cent., from pulmonary tuberculosis by 64 per cent., and from other forms of tuberculosis by 77 per cent. Their studies confirm the generally accepted view that few children in contact with tuberculosis fail to react to tuberculin within the first few years of life. Where there is no known contact with tuberculosis the frequency of positive reactions increases gradually from infancy to adult life, so that at about the age of 20 nearly everyone is sensitive to tuberculin. Similarly *x*-ray examination reveals lesions far more frequently in children in contact with tuberculosis than in those who are not exposed to a like risk. Most of the authorities cited by Drs. Dow and Lloyd found a higher mortality *from tuberculosis among children born of infected* parents than among children who were not exposed to infection. But in view of various discrepancies in the figures obtained from different countries the authors themselves made an inquiry into the fate of children who had been in contact in varying degrees with cases of tuberculosis. In their series, representative of an average working-class population, they found that the mortality rate of *exposed children* under 1 year of age was about twice as high as that of children who had not been exposed to infection—the figures being 1·3 per cent. and 0·58 per cent.—and that the death rate within the first five years of life of children who had lived from birth in contact with a parent with positive sputum was 2·6 per cent.

MATERIALISM IN BIOLOGY

IN the Herbert Spencer Lecture, delivered at Oxford in June, Sir Peter Chalmers Mitchell discussed the present position of materialism.[1] It is the opinion of many at the present time that materialism has been found wanting as a working principle. It has even been suggested that religious insight may safely be employed as a guide to scientific insight. The tendency is not confined to philosophers so called, but is exhibited by some distinguished men of science, and, in the lecturer's opinion, threatens to introduce an undesirable subjective and emotional element in scientific work. An examination of the record of recent scientific progress, however, has convinced Sir Peter Chalmers Mitchell that, so far from materialism having lost ground, it has become more firmly established than ever, since Spencer wrote. He adduces many instances of scientific discovery in support of this opinion, such are the demonstration by Butschli that many of the properties of protoplasm which were supposed to depend on some mysterious vital force may be reproduced in colloid solutions, the artificial manufacture of sugar and other products of vegetable and animal life, and the general trend of medical history, exhibiting a continual replacement of more or less mystical causes by material agents. Certain it is that in the science of living beings many functions formerly attributed to "vital force" are now satisfactorily referred to mechanical and physico-chemical forces. Science still finds materialism the best working hypothesis. With regard to the causes of the present tendency towards the mystical—the doctrines of creative urge, entelechy, holism, creative evolution, values, and other theories to explain on imaginary principles what has not yet been referred to matter—the lecturer dismisses the subject with a few brief suggestions. Development of the argument in this direction would have been interesting. Spencer recognized a class of things as unknowable. As realities, they necessarily come within the cognizance of science and cannot be ignored. Many regard them as the most important class of realities. In dealing with them—"the things invisible but real," to use the comely phraseology of Pascal—mankind has unconsciously employed the scientific method of working hypotheses, accepting them as beliefs in default of material proof, testing them, not by experiment, but by experience, retaining them while fruitful, rejecting them for better. The progress of human culture in such particulars as architecture, painting, sculpture, music, literature, ethics, and civilization generally has been largely dependent on these hypotheses, possibly, for humanity at its best, they are indispensable. They suffer, however, under a serious disability: they are not formulated and discarded with the freedom and readiness exhibited in the case of materialistic hypotheses, when worn out they are hard to replace. It would seem that certain scientists of the present day are engaged in an attempt to build up, on the ruins of our old faiths, a rationalized belief, bringing material and "invisible" realities into closer relationship, or to provide a satisfying creed on

[1] *Materialism and Vitalism in Biology.* By Sir Peter Chalmers Mitchell, C.B.E., F.R.S., D.Sc., LL.D. The Herbert Spencer Lecture delivered at Oxford, June 3rd, 1930. Oxford: The Clarendon Press. 1930. (Med. 8vo, pp. 30. 2s. net.)

more materialistic line. The old way is probably the better, but it would be ungracious to criticize these attempts too closely without tentatives there is no progress. The most recent attempt is that formulated in Professor Wardlaw's book *The Creed of a Biologist*[1] and runs: *I believe in the Law, in the immortality of the germ plasm, and in the creative progressive evolution of life in the variability of value of the germ plasm through heredity and environment in the transmission of acquired characters, and in the conscious improvement of the race through the laws of volitive eugenics. I believe that the aim of the individual life is the protection, improvement and continuation of the immortal germ plasm, and that this is best secured by self-development in the highest possible degree, through a permanent monogamic sex-partnership with limitation of offspring towards securing the best possible results in the progeny and their best preparation for the continuation of the process in the next generation.* In this belief, the Universe is rationalized for my intelligence and reason. I accept it with optimism, relinquishing all desire for personal immortality, and unafraid believing that whatever gods may be the game of life will have been played squarely and according to the law."

A SURVEY OF ANATOMICAL DEPARTMENTS

THE seventeenth series of *Methods and Problems of Medical Education*,[2] which is distributed gratis to teachers and administrators in medical schools and hospitals and to others interested in this important subject, contains twenty-eight articles from the directors and teachers of departments of anatomy, histology and embryology. Nearly all parts of the world are represented—for example the teaching in India is described in the medical colleges of Calcutta, Patna, and Bombay. Professor W. A. Mysberg gives an account of the anatomical department at Batavia, Java, Dr. M. R. Drennan of the Wernher Beit anatomical department at Capetown, Professor Ricardo Palma of the anatomical department of San Marcos University, Lima, Peru, and Professor Arturo Garcia of his department in the University of the Philippines. The first article, by Dr. S. R. Detwiler of Columbia University, though short, is extremely interesting, as it sketches the modern scope of anatomy, his first sentence is significant:

> The conception of anatomy as a purely morphological science represents a state of mind which is gradually ceasing to exist among biologists." It is, he insists, a dynamic, not a static, science and is concerned with all biological phenomena dealing with the problems of form and form-regulation in animals. "In the past anatomy did not keep pace with other biological sciences, largely because human anatomy, on account of its practical applications, was for a long period in great danger of becoming merely a handmaid to medicine and surgery. Nowadays anatomical departments must be equipped in the same way as those of experimental biology. Three other accounts of anatomical teaching in the United States of North America are given from Baltimore and Philadelphia, the latter being represented by descriptions of the University of Pennsylvania department and of the Wistar Institute of anatomy and biology. This famous institute has its own press, and gives financial help to a group of anatomical and zoological journals, in addition, its extensive animal building, where experiments in breeding rats have so long been carried out, and the museum dating from 1808, deserve a passing notice. At Aberdeen—the British representative in this instalment—the professors of anatomy and physiology are, in virtue of their office, consultants to the Royal Infirmary, in order that they may co-operate with the physicians and surgeons in teaching and research. Professor P. J. Berry, who gives an account of the department of anatomy and histology in the University of Melbourne, has based on the principle that anything bearing on the life of man—physical anthropology, anthropogeography, prehistory, development, heredity, neurology, and even human behaviour—is a fit and profitable field for anatomical research. At the University of Alberta the staff of the anatomical department is carrying on research on the innervation of the heart, the comparative histology of the islands of Langerhans, and the nerve characteristics of the skin. There are a number of well-illustrated articles describing the anatomical departments in Japan, Czechoslovakia, Rumania, and Bulgaria.

EXCESSIVE PRESCRIBING: EXCESSIVE PENALTY

We regret to learn from the senior partner of a firm of practitioners concerned that the matter has not been settled. The Ministry of Health has, it the Minister upholds the penalty of £100 which the London Insurance Committee asked him to inflict on them as a punishment for excessive prescribing. The action taken by the London Panel Committee in May 1929 was briefly recorded in the *Supplement* of June 22nd 1929 (p. 246). On that occasion a subcommittee, to which the matter had been referred for inquiry, reported that in its opinion the prescribing of the firm of practitioners had not been in excess of what was reasonably necessary for the adequate treatment of the insured patients; the committee however rejected this finding and remitted the whole of it. The chairman referred the question to another subcommittee whose report, adverse to the practitioners, was adopted by the Panel Committee. The irregularity of the procedure [illegible] Ministry of three referees who had [illegible] regretfully to the conclusion that [illegible] considerable expenditure on drugs and medicines was reasonably necessary. The referees added that the object of the proceedings was deterrent and not punitive, and therefore they recommended that the penalty should not be more than sufficient to exercise that deterrent effect. They also expressed the utmost confidence in the bona fides of the practitioner and his partners. "The high ideals with which the members of the firm are possessed are quite admirable, but it is impossible to countenance such idealism at the expense of a limited public fund earmarked for a specific purpose only." In the *Supplement* of February 8th, 1930 (p. 41), we recorded a meeting of the London Insurance Committee, at which after considering the referees' report the committee resolved to ask the Minister of Health to withhold £100 from the money payable to it with a view to this sum being deducted from the remuneration of the practitioner concerned. Then in the *Supplement* of May 3rd (p. 202) we recapitulated the story in outline, and published a statement put in by the practitioners when making oral representations to the Ministry in March. We are aware of the many claims on a Minister's attention; nevertheless it is unfortunate that Mr. *Greenwood* should have taken four or four months to make up his mind on this matter and worse than unfortunate that his decision to impose the penalty instead of a merely nominal fine should be announced until after the close of the [illegible] been announced until after the close of the British Medical Representative Meeting.

NATIONAL COUNCIL FOR MENTAL HYGIENE

A new bulletin has been [illegible] Council for Mental Hygiene interest and report [illegible] last twelve months [illegible] holding a series of

[1] *The Creed of a Biologist.* By Alfred Scott Warthin, Ph.D., M.D., LL.D. London: Constable and Co. Ltd. 1930. (Cr. 8vo, pp. viii + 61, 5s. net.)

encouraging that they will be continued Seven lectures were given last autumn by well-known authorities on such subjects as adjustment to life at different ages, problems of youth, the woman wage-earner, and mental and nervous problems of everyday life A second series of six lectures dealt in the spring of this year with the new psychology and the parent, the training of children sex education, and choosing a career It is announced that during the coming autumn similar lectures will be delivered on Thursdays at 5 15 p m The popularity of the conference held last autumn in Westminster has led to the decision to arrange a similar gathering in May, 1931 A report of the proceedings of last year's conference has been published by Messrs Adlard and Son price 2s, and is obtainable from the council, the Tavistock Square Clinic, or any bookseller The profits from the sale of this report will be divided between the council and the Tavistock Clinic The bulletin of the council contains comments on the progress of the Mental Treatment Bill (which became law on July 10th), and an account of the first International Congress of Mental Hygiene held in America last May Brief notes are supplied on the work of subcommittees of the council during the last year, this included the drafting of a memorandum on the subject of attempted suicide, and the preparation of two reports, one relating to the present facilities for the immediate care and treatment of persons suffering from mental and nervous disorders, and the other to the hostel system for the treatment of mental defectives The importance of preserving close contact with the work of parallel societies in foreign countries has been recognized and a special secretaryship has been created by the council to this end It is announced that the council is now in a considerably stronger financial position than it has ever been, but so large a programme lies ahead that further support is urgently necessary It is hoped to appoint a whole-time medical director, with the necessary staff and suitable offices, to organize summer schools and conferences, to promote research into the causes of every form of mental disease, and to establish clinics for early mental cases throughout the country

---

BRITISH gynaecologists and obstetricians who may be travelling in the United States before or after the Annual Meeting of the British Medical Association in Winnipeg at the end of this month are invited by Dr Samuel R Meaker to visit Boston, where he will show them the most interesting features of the gynaecological and obstetrical work in that city Those who would like to take advantage of this friendly invitation should communicate with Dr Meaker, at 475, Commonwealth Avenue, Boston, Massachusetts

---

By an Order of the Committee of Privy Council, made after consultation with the Medical Research Council and with the President of the Royal Society, Sir Charles Sherrington, O M, G B E, M D, F R S, Wayneflete Professor of Physiology in the University of Oxford, and Sir Almroth Wright, F R S, honorary bacteriologist to St Mary's Hospital, London, have been appointed members of the Council, in succession to Sir Frederick Gowland Hopkins, F R S, and Sir Charles Martin, C M G, F R S, who retire in rotation on September 30th

---

We regret to announce the death, on July 26th, of Dr A Bertram Soltau, C M G, C B E, senior physician to the South Devon and East Cornwall Hospital, Plymouth, and honorary consulting physician to the Ministry of Pensions Chest for gassed cases We hope to publish an obituary notice in an early issue

ADMINISTRATION OF THE MENTAL TREATMENT ACT

LOCAL AUTHORITIES AND THE BOARD OF CONTROL

A CONFERENCE on the Mental Treatment Act was summoned by the Board of Control for July 22nd and 23rd, and was attended by delegates from local authorities and mental hospitals in all parts of the country

Mr L G BROCK, chairman of the Board of Control, who presided, said that the Board was reluctant to issue a circular giving advice until it had had the opportunity of conferring with the local authorities which would be concerned in the administration of the new Act The Act, in his view, marked an enormous advance on previous legislation, and a change in the whole attitude towards the treatment of mental disease, but it needed to be worked in a spirit of cordial co-operation between the local authorities and the centre He read a letter from Lord Macmillan, who was chairman of the Royal Commission, stating that he welcomed the important advance which the *Act embodied, and thought the provision made for the* reception of voluntary patients in mental hospitals would prove of great value by enabling curative measures to be adopted in the initial stages of mental disturbance

The MINISTER OF HEALTH (Mr Arthur Greenwood), who addressed the conference on the second day, said that it was the desire of the Government that there should be the fullest consultation between the central and local authorities He hoped that during the coming months those concerned in local administration would utilize the experience of the Board of Control, with its special knowledge of the provisions of the Mental Treatment Act The *Board was desirous of dealing with the problems involved* in a sympathetic and constructive spirit The Act meant that the community must cease to think of mental disease as something so indecent as to require to be placed in a separate category, it was a section of the general public health problem of this country In the treatment of mental disease and in dealing with people suffering from any form of mental disorder, the closest contact ought to be maintained with the general health services, hospitals, and so forth Psychological medicine must not be regarded any longer as a separated thing, surrounded by a ring fence As illustrating the problems attending the subject he pointed out that although nobody would challenge a division against the Mental Treatment Bill on second reading, yet many weary weeks were spent in committee on getting it through It might have been possible to attempt a big revolution in lunacy administration, but to-day such a measure would have been one of those slaughtered bills which at this period of the session the Government was compelled to sacrifice This Act was on the Statute Book, and marked a great step forward in a field of public health too long ignored It placed new responsibilities on the local government authorities, but new responsibilities always meant new opportunities The Act would be very carefully watched by enlightened members of the public Many more questions would be asked in Parliament on lunacy administration "I shall not complain, but it means that when I am in the dock you are in the dock My only regret is that I cannot keep you in permanent session, and carry you across to the House to support me when a question is asked about this problem" Within the next few years there would be a great development in voluntary treatment, an enormous increase in the number of people who were being treated in the early stages, and a corresponding diminution in the number of certified cases "I have done my best to give you as good a bill as parliamentary circumstances would allow You asked for these powers, you have got them, and I hope you will use them"

Five main subjects were debated by the conference The first was on out-patient clinics, as to which the general view was that they should be in association with general or cottage hospitals Professor G M ROBERTSON of Edinburgh said that the immediate thing to do was to get the out-patient clinics started in as many places as possible and to consider their lines of development afterwards With them was bound up the objective of the new Act,

which was the medical treatment and prevention of mental disease, instead of, as in the past, the custody of the dangerous insane.

DR T BEATON, medical superintendent of Portsmouth Borough Mental Hospital, in opening the discussion on voluntary patients, spoke in optimistic terms of the possibilities afforded by the admission of the voluntary boarder to the public mental hospitals. Those concerned in administration must be prepared for curious paradoxes, and many patients who in the ordinary way would have been certified would be found admitted as ordinary boarders because they preserved a certain logical continuity of thought. It was important that the staff should not regard the voluntary boarder as a new phenomenon, and they should be taught to make as little difference as possible between the boarder and the certified patient. Another danger was that as the mental patient was a constant source of worry and irritation to the general practitioner, he might be tempted under the new arrangements to unload him on to someone else at the earliest opportunity. MR BROCK said he wanted to allay any apprehension that the voluntary patients would cost the local authorities a lot of money. The great bulk of the patients who were going to be so treated would under the old dispensation have been certifiable.

A discussion also took place on temporary patients under Section 5 of the Act. SIR HUBERT BOND said that this was perhaps the most important of the sections. It got rid of magisterial intervention for a time sufficiently long to enable effective treatment to be applied. It avoided the necessity of compelling a patient as a preliminary step to treatment to be certified as a person of unsound mind and thus removed a formidable bar to early treatment. MR BROCK announced that the Board of Control was about to draw up a list of approved practitioners for the purpose of signing recommendations for treatment of non-volitional patients under Section 5 of the Act. This was a delicate and invidious task for which the Board had set up a committee under the chairmanship of Sir John Rose Bradford, and the principal medical bodies had been invited to nominate members. (On the previous day the Council of the British Medical Association nominated Dr R C Cordon as its representative on this committee.)

The question of research was broached by Professor SHAW BOLTON who hoped the time would soon come when the diploma in psychological medicine would be regarded as the essential qualification for a permanent post in a mental hospital. From the university point of view a psychiatric institute or department was ideal, in his opinion, and it was from the university that mental disease should be taught. He complained that large numbers of medical officers in mental hospitals were unable to secure leave in order to undertake the necessary training for the diploma. Local authorities controlling mental institutions should be asked to allow study leave for three months with salary and emoluments, on the understanding that a certain minimum period of further service was guaranteed. Dr B H SHAW (Stafford County Mental Hospital) commented on the fewness of the mental hospitals in which there were laboratories for the actual investigation of mental disorder, and indicated a number of outstanding problems to which such laboratory investigation might address itself.

In opening a discussion on after-care, Dr J R LORD, medical superintendent of the London County Mental Hospital at Horton, suggested to local authorities that they should regard after-care treatment as best centralized in a national organization which could keep in touch with employers everywhere and establish and maintain convalescent homes and institutions conveniently situated for the use of them all. Such a body could also afford adequate training and experience in case work to social workers whose abilities and character rendered them specially suitable for such work. He thought that local authorities should guarantee an appropriate sum to the Mental After-Care Association which would wholly or partially support a specially trained after-care worker in the district making full use of the association's institutions, paying the full maintenance charges for their patients so accommodated, and make an annual grant to the association to be expended on institutional developments.

Scotland.

Reception to Medical Graduands.

SUCCESSFUL students at the recent final medical examination in Edinburgh were entertained on July 22nd by the Edinburgh Division of the British Medical Association at the Association's House in 7 Drumsheugh Gardens. Dr J M Bowie was in the chair, and Sir Leslie Mackenzie delivered an address on 'The new era in medicine', reviewing the progress made during the last forty years and commenting on the openings for further advance. Great possibilities in preventive medicine he said had been brought about by an alteration in outlook such as had been effected by Koch's discoveries. When the Local Government Board for Scotland issued its tuberculosis circular twenty-four years ago there was hardly a bed for this disease in any municipal or county hospital to-day there were about 5,000 beds in charge of specially trained medical practitioners. Radiology had created a new world of diagnostic methods and treatment and revealed how future progress must be sought along the lines of training in scientific technique associated with unremitting research and experiment. Although an immense amount was being done as regards the examination of children in the State-aided schools and the provision of treatment little if any change had been made in the training of medical students to utilize the information obtained in school clinics. Medical schools, indeed, gave hardly any instruction in the application of clinical methods to the definite purpose of preventing disease. Sir Leslie remarked: "The medicine of the future will rest on this type of test—namely that the clinical candidate shall be so trained in clinical methods that he will be as able to assess the fitness of a person for the purposes of civil life as he now is to give a prognosis in a case of bronchitis." It was curious he added that with all the advances made in technical methods of diagnosis the main reliance was still placed in hospitals, dispensaries, and out-patient clinics on the mother's diagnosis of disease. Until the child was so ill that the mother thought the doctor should be informed the treatment of the child was delayed, and while this 'maternal diagnosis' type of medical practice persisted preventive medicine in the form of individual treatment could hardly begin. In the school clinics defects and ailments were sought out by professionally trained examiners; they were not left to the mother for discovery. Yet the material so brought to light was outside the scope of the medical curriculum and examinations; consequently when anyone decided to study clinical medicine on its preventive side he had to seek out new teachers and receive training in the earlier diagnosis of disease. Sir Leslie Mackenzie then passed to a brief consideration of the proposals for a general medical service elaborated by the British Medical Association which he thought covered all phases of medical practice. The greatest problem," he said, "in the medical organization of the next ten years will be the method of enabling the private patient, through his doctor or otherwise, to get the full advantage of the splendidly equipped institution now available for both diagnosis and treatment. Meanwhile the new local government system makes it possible to organize on a public basis the many medical services provided or to be provided. In conclusion he hoped that the new developments in public medical service would be so adjusted to the voluntary and private medical services that no patient in need of any form of treatment would look for it in vain.

Medical Graduation at Edinburgh.

A graduation ceremony was held on July 22nd in the McEwan Hall of the University of Edinburgh under the presidency of Principal Sir Thomas Holland. More than one hundred students received the degrees of M B, C B, and there were twenty-two recipients of the M D degree. Among the latter gold medals were awarded to Dr J S Fulton for a thesis [illegible] The extensibility of the arteries in man; to Dr [illegible] for a thesis on The mechanics of internal [illegible] and to

DR F E REYNOLDS, whose thesis was "A pathological study of the pathways of infection to intracranial structures from the nose and its accessory cavities." After the degrees had been conferred an address was delivered by the promoter, *Professor* D P D WILKIE, who recommended the new graduates to seek at first a hospital appointment. Whatever their ambitions might be, he considered that a hospital training should be as wide and varied as possible. He advised them not to be concerned about their ultimate vocation, for a career in medicine was determined by evolution rather than by self-determination. Medicine as a profession offered a limitless field for the exercise and development of their individual gifts and for the development of personality. Referring to research Professor Wilkie said that some of the most pressing problems must be solved by clinical study in the wards of hospitals, opportunities for research were not confined to laboratories. The most urgent need of this medical school was the adequate endowment of research in clinical work. Most graduates would find that the general practice of medicine constituted their life-work for this in his opinion, a knowledge of practical psychology was the most essential equipment. They must love their work, the one thing that most surely defeated growth and development in the art of medicine was the introduction of the commercial spirit into practice. True ambition in medicine should be not so much the making of a living as the making of a life. He thought that each of them should attempt to educate their clientele to regard the services of doctors as primarily for the care of health rather than for the cure of disease. If every patient was examined at intervals of six months after the age of 40, early deviations from health would be detected during the curable stage of many diseases, and a new era in medicine would be inaugurated.

Research in Animal Diseases

Dr HENRY DRYERRE has been appointed physiological biochemist to the Animal Diseases Research Institute at Moredun, Edinburgh. For about ten years Dr Dryerre has been lecturer in physiology at Edinburgh University and professor of physiology at the Royal (Dick) Veterinary College, a post which he is retaining. He has published important observations dealing with the effect of thyroid extract upon the response to adrenaline, and with the action of thyroid preparations upon the autonomic nerves, and he has recently been engaged upon the elucidation of the problem of milk fever and its relation to the endocrine glands. Mr W S GORDON, M.R.C.V.S., has been appointed senior bacteriologist to the same institution. He has been working for some years at the Wellcome Research Laboratories, and is well known among Scottish agriculturists for his investigations into lamb dysentery and braxy.

England and Wales.

An Outbreak of Enteric Fever near Portsmouth

DR A MEARNS FRASER, medical officer of health for Portsmouth, has issued a report on a localized outbreak of enteric fever in the Landport district in June. Following a Sunday school outing on May 29th, in which 118 children and 10 adults took part, several cases of enteric fever developed. It appears that 99 of the party drank from a stream running through the woods, and 18 of these contracted enteric fever, 29 suffered from severe attacks of abdominal pain, diarrhœa, or vomiting within three days of returning home, and a further 23 had gastro-intestinal symptoms during the next three weeks, in which period no illness that could be attributed to the excursion occurred among the remainder of the party. An investigation was conducted into the circumstances attending this outbreak, and it was shown that, although in a few of the cases the incubation period was rather longer than usual, yet in none was it incompatible with the suggestion that the disease was contracted on May 29th. Five patients, who subsequently developed enteric fever, had an attack of gastro-intestinal disturbance within a day or two of drinking the water, followed by an interval of apparent good health before the graver disease became manifest. The fever was of a moderately severe type, but up to the present no deaths have resulted. In nearly every case the diagnosis was confirmed by the Widal test. At a subsequent examination the bed of the stream showed marked evidence of sewage pollution, and this was confirmed by analysis. It is stated that the stream received the effluent from sewage works, and it is suggested that there may have been insufficient purification. No other recent cases of enteric fever have been notified in the district concerned.

Epsom College

Founder's Day was celebrated at Epsom College on July 26th, when the prizes were distributed by Lord Burnham, president of the College. The head master, after commenting on the value of past achievements in stimulating progress, mentioned the more prominent distinctions won by past and present members of the school, and referred with gratitude to the new dental scholarship which had been offered by Guy's Hospital, this being he thought, the first of its kind in history. An open scholarship for natural science had been won at Trinity College, Oxford, and another open scholarship for classics in the same university at Pembroke College. A scholarship had been gained at Jesus College, Cambridge, and also an open exhibition at Faraday House Engineering College, while the top place in the Law Society's final examination had been obtained by an Old Epsomian. School successes last year included thirteen passes in the first medical examination, and seventy-two school certificates, with six honours, forty-three exemptions from matriculation, and six distinctions. The athletic successes included an unbeaten Rugby football team and a cricket team which had not been defeated by any other public school. Although last year it had been announced that the council could not proceed yet with the building of the new sanatorium until considerably more money was forthcoming, it had now been decided that the first steps must be taken without further delay in the late autumn. It was hoped that the new building would be ready by January, 1932, the existing sanatorium would then be converted into a house for forty boys, bringing the total up to 450, the maximum number which the council had decided to admit. With the erection of this new building the scheme of reorganization and enlargement formulated in 1924 by Dr Raymond Crawfurd, chairman of the council, would be completed, and this in a period of seven years as contrasted with the original estimate of ten. Other additions and improvements included the construction of a new rifle range, and the erection of a large cricket score board. Lord Burnham delivered an address in which he emphasized the value to any school of a practical bias towards one or other of the lines of education. He emphasized the importance of general intellectual training even though some measure of specialization was inevitable. Dr Raymond Crawfurd, proposing a vote of thanks to Lord Burnham, gave a few details about his predecessors in the presidential office. A new feature in the Founder's Day programme this year was the inclusion of a first-class assault-at-arms, produced in the open air in spite of inclement weather. In the evening the choral society rendered 'The Gondoliers" to a warmly appreciative audience.

Renaming of London Hospitals

The London County Council is proposing to rename some of the hospitals and institutions under its direction. Some of the present names are unsuitable owing to the situation of the hospital (which is not in the locality suggested by its title) or because they are cumbersome in themselves. Ten of the transferred Poor Law hospitals bear names of saints, and twenty bear geographical names. It was at first intended to give them all saints' names, but after consultation with visiting subcommittees and others the idea of a uniform system of nomenclature was abandoned. Among the hospitals to be renamed are the following (the new name is placed in brackets): Bermondsey and Rotherhithe Hospital (St Olave's Hospital), Greenwich and Deptford Hospital and Institution (St Alfege's Hospital), Holborn and Finsbury Hospital (Archway Hospital), Plumstead and District Hospital (St Nicholas's Hospital), St Marylebone Hospital (St Charles's Hospital), Southwark Hospital (Dulwich Hospital), Tooting Home (St Benedict's Hospital).

Papworth Village Settlement

Prince George visited the Papworth Village Settlement in Cambridgeshire on July 23rd to open the new cabinet-making work shop, the foundation stone of which was laid twelve months ago by the Duke of York. Expressing his pleasure at being associated with this valuable form of treatment he commented on the way in which the feeling of helplessness due to the incapacitation of tuberculosis was being overcome by the provision of suitable employment. The health of the children who were brought up in the Settlement seemed to prove that this disease was not hereditary. More financial assistance was urgently needed in order to secure extension of the work, and there should be other similar settlements elsewhere. Sir Frederick Milner emphasized the value of the great interest which members of the Royal Family had taken in the work of Papworth and added that the present Government, as well as its predecessor, had done all it could in the way of encouragement. Prince George was conducted through the workshops and spent a considerable amount of time in the trunk-making department.

Correspondence.

OBSERVATION AND EXPERIMENT

SIR,—To some of the more old-fashioned among your readers it is a pleasure to find an article which is not illustrated by graphs or chemical equations. It is a rare pleasure to come upon an article frankly concerned with the theory of medicine such as the masterly survey of the methods of observation and experiment presented by Mr. Wilfred Trotter in the *Journal* of July 26th (p. 129).

I fancy that it is possible to detect Mr. Trotter hankering after the discredited art of observation in spite of his impartial survey and the full credit given to the achievements of experiment. Perhaps the time has come when a plea should be entered for observation, before a complete breach with tradition shall have destroyed its continuity as a method. If I remember aright it was Jenner who was given the advice, "Don't think—experiment." This may have been well enough for a Jenner but I fear it has proved dangerous advice for many of his successors who have obeyed the injunction all too literally.

In considering the results of experiment run riot I think particularly of the study of tuberculosis. But since tuberculosis may justly be said to be an epitome of medicine, the circumstances of the special case are applicable to medicine as a whole. We have piled up to-day a mass of experimental evidence which no individual is able to cope with. The serious student is bewildered by the spectacle of an ever-increasing mountain of facts and statistics accumulated by the method of experiment. He looks in vain for a guide who will tell him what these things may mean or even if they mean anything at all. It might be well for us to borrow from the ecclesiastical usages of an earlier day which ordained days of humiliation in times of stress. In tuberculosis at least a year of humiliation might not be amiss if it gave us more thought and less experiment and above all if it gave us, not more facts, but an interpretation of the facts.

Over a century ago Louis in his *Researches on Phthisis* spoke of one of the central principles of his study as calling for the "meditation of observers in all countries." I fear that Louis's plea for meditation is little heeded in these days. Will someone point the way?—I am, etc.,

Frimley, July 28th. W. M. MACPHAIL.

DIFFRACTION METHODS IN DIAGNOSIS OF PERNICIOUS ANAEMIA

SIR,—Recently a number of papers appeared in the *British Medical Journal* advocating the use of diffraction methods in the diagnosis of pernicious anaemia, the most recent is that by Dr. Mallov in the issue of July 19th (p. 86). While I have not used Dr. Mallov's direct comparative diffraction method, Professor Gulland, Dr. Goodall and I have tried various diffraction instruments which are on sale at present. The principle of the diffraction method depends on the finding that the diffraction halo produced by passing a beam of light through a blood film varies in size inversely with the average diameter of the red blood corpuscles. The size of the halo is generally measured by the size of the red ring in the spectrum.

Dr. Mallov admits that the red ring mingles to a varying degree with the orange and violet. The personal factor accordingly becomes of great importance. This is quickly realized by anyone who has tested various diffraction instruments. Dr. Mallov himself states in regard to Eve's haloimeter that different observers, even with practice, obtain different results with the same slides. It is obvious that the difference between the size of the halo in a normal blood and that in a case of pernicious anaemia becomes more and more apparent as the degree of megalocytosis becomes greater. In practice it is found that in severe cases of pernicious anaemia with a colour index well over unity diffraction methods undoubtedly give an accurate diagnosis of a megalocytic anaemia. Such cases however are easily diagnosed by a blood count, or in the case of experienced haematologists, by a glance at a stained film. In cases in the remission stage of pernicious anaemia, or in chronic cases where the blood corpuscles number between three and four million, great difficulty in diagnosis is presented, no matter what method is used.

Cabot has demonstrated that in a large percentage of such cases the colour index is unity or below unity—that is, between 0·8 and 1. Price-Jones has shown by measurement that the mean diameter of the red cell in such a case varies from normal by a mere fraction of 1 μ. Taking into consideration the personal factor in accurately assessing the edge of the red ring in the halo, it would be unreasonable to expect that such slight alterations in the size of the red cell can be accurately judged by the eye. A profound knowledge and experience of haematology is required in such cases before a diagnosis can be made. This entails an investigation of (1) the white cell picture with reference to the Arneth count, leucopenia and relative lymphocytosis, (2) the blood platelet picture to detect thrombocytopenia and any increase in the size of the platelet, (3) the red cell picture—for example, megalocytosis, ovality in shape and the coefficient of variation, (4) a test meal, and (5) the van den Bergh reaction, etc. My object in writing this letter is to warn the general practitioner against assuming that diffractive methods are a safe short cut to diagnosis and that any method can dispense with a complete blood examination.

Dr. Mallov under the heading "Prophylaxis" refers to another point which I have seen in several papers in the *Journal* which requires comment. He states that, according to Hurst pernicious anaemia is due to an infection of the duodenum by haemolytic streptococci. I must emphatically maintain that haemolytic streptococci are in no way associated with pernicious anaemia. In a series of nearly fifty cases I found them present in the gastro-intestinal tract *in about 5 per cent of cases*. Similar results have been published by Moench, Kahn, Torry and by van der Reis, who isolated haemolytic streptococci in only one out of thirty samples of duodenal contents of cases of pernicious anaemia. Portal haemolysis is now recognized to have no place in the etiology of pernicious anaemia and there can be no doubt that no specific organism for this disease exists.

Hurst's work on the importance of achlorhydria as an etiological factor in pernicious anaemia deserves the highest recognition. The achlorhydria however must be considered as an indicator of a deficient secretion not only of hydrochloric acid, but of some secretion necessary for protein metabolism from which is produced the specific factor necessary for normal blood formation. In the majority of cases Hurst himself showed that the achlorhydria was congenital, and not acquired as the result of sepsis.

For a full discussion of these points the reader is referred to the monograph on *Pernicious Anaemia* by Professor Gulland and myself published by Henry Kimpton 1930.—I am, etc.,

Department of Medicine, Edinburgh University. STANLEY DAVIDSON, M.D., F.R.C.P.Ed.

"PRE-PERNICIOUS ANAEMIA" AND "MEGALOCYTIC ANAEMIA"

Sir,—Dr J H Malloy's paper on the direct comparative diffraction method of demonstrating megalocytosis (July 19th, p 96) is, of course, of great interest, but it contains one statement which is, I feel, open to doubt Dr Malloy writes "Hurst has shown that the primary condition is achlorhydria which allows of infection of the duodenum by a haemolytic streptococcus" He follows this by contending that "it would seem to be more helpful to call the interval between infection and the onset of anaemia the incubation period of pernicious anaemia"

It is generally agreed that the achlorhydria of pernicious anaemia is, in the great majority of cases a constitutional condition—that is, present throughout life How, then, can one determine the time of infection and so the length of the incubation period? One must agree with Dr Malloy that the term "megalocytic anaemia" should not be used as a synonym for *pre-pernicious anaemia*, but it should be clearly understood that even the latter state is not necessarily unaccompanied by symptoms—I am etc,

Cancer Hospital Fulham Road S W 3 July 22nd — A Piney

GLANDULAR FEVER AND THE WASSERMANN REACTION

Sir,—Very little allusion, so far as I know, has been made to the Wassermann and Meinicke reactions in glandular fever In three cases recently at the German Hospital in which these reactions were tried, one or the other, or both, of these reactions were found to be temporarily positive, as pointed out in my article in the *Medical Press* (1930, vol 181, p 65) This need not necessarily be so in all cases Indeed, Dr M W Cantor in the *Journal* of June 28th (p 1197) mentions that the Wassermann test was employed in one of his cases with negative results, but the Meinicke test was not tried

From another diagnostic point of view our cases help to show that glandular fever may occur without obvious enlargement of any of the superficial lymph glands or of the spleen—a point not mentioned, I believe, either in Glanzmann's recent monograph or in the various articles by H L Tidy, or in the contribution by G Evans and W A Bobb (*Journal*, June 7th, p 1039) In regard to the "lymphotropic" blood picture (that is to say, the "mononucleosis") of glandular fever, it is of course well known that to some extent similar lymphotropic counts are obtained in such common infections as German measles, whooping-cough, and mumps it may turn out that the same will be found in as yet undiscovered specific minor infections which probably still lie hidden among the vast number of cases diagnosed as "influenza," or as vague gastro-intestinal or abdominal attacks—I am, etc

London W 1 June 23rd — F Parkes Weber

PREVENTION OF DERMATITIS IN THE SURGICAL PREPARATION OF THE SKIN

Sir,—The profession should be grateful to Mr R C Alexander for the publication of his case of fatal dermatitis following the use of iodine spirit solution (July 19th, p 100) This case has recalled to my mind quite a number of milder cases of dermatitis following the use of both iodine spirit and picric acid spirit solutions which produced a mild form of toxaemia and caused a considerable amount of discomfort to the unfortunate patients

Two years ago a young woman who had had an abdominal *section performed* four weeks previously was suffering so much discomfort from an extensive picric dermatitis that I was called in to examine her and advise as to treatment Three years ago while making a tour of the surgical clinics of Canada and the United States, I was impressed by the general use of mercurochrome for the preparation of the skin, and since then I have used this method in my hospital and private practice My routine is to have the operation area washed with ether soap, shaved, well swabbed over with spirit, and mercurochromed applied The area is then covered in the normal way with a sterile towel, on the operating table it is swabbed with surgical spirit, dried with a sterile swab, and mercurochrome is again applied The mercurochrome solution is prepared as follows 2 drachms of mercurochrome are placed in 35 c cm of distilled water, and 55 c cm of 95 per cent alcohol and 10 c cm of acetone are added The acetone dissolves the fats Although the above is the original prescription, in practice I have found that industrial alcohol, which contains 75 per cent of alcohol and is, of course, much less costly, has proved to be quite efficient During the three years I have used this preparation I have not seen a case of dermatitis, and the after-results have given me entire satisfaction

Two objections have been raised against the method—namely, the cost and the staining of the skin With regard to the cost if industrial alcohol is used, mercurochrome solution works out at only a few pence more per 100 c cm than 2½ per cent iodine spirit solution, thus the first objection is readily dealt with The staining of the skin is not objectionable to the patients, and in any case wears off in two to three months, or can be easily removed by washing with a solution of sodium hypochlorite No toxic effects have ever been met with in my skin application method, yet the penetrative action is greater than that of either iodine or picric acid, and the bactericidal action is far superior Experimentally the lethal concentration of iodine in aqueous solution against *Staphylococcus aureus* is about 1 in 10,000, while that of mercurochrome is about 1 in 10,000,000 the antiseptic potency of mercurochrome is roughly one thousand times greater than that of iodine

In confirmation of these experimental data I can state that, during my experience of that drug, I have never had a case of skin contamination of the operation wound Should Mr Alexander adopt this method I venture to suggest that he will welcome the advent of mercurochrome—I am, etc,

July 22nd — R Bertram Blair, M B, F R C S Ed, Honorary Surgeon Hull Royal Infirmary

DERMATITIS FOLLOWING USE OF IODINE SOLUTION

Sir,—The descriptions of iodine dermatitis by Mr Charles Alexander and Dr de Bouk recorded in the *British Medical Journal* of July 19th and 26th prompt me to record a case I had

A man aged 55 (who had used iodine previously without any ill effects) had some rheumatic pains in his right arm Some tinct iodi mitis was bought at a local chemist's and applied over the area affected The following day my then partner was called in to see this patient and was surprised to see a case of acute miliant poisoning following the application The whole body from the head to the soles of the feet was one mass of blisters We treated him as a case of bad burns, and he made an uneventful recovery He was confined to bed for a period of six weeks

—I am, etc,

London N W 10 July 25th — L Schapira

DIATHERMY IN GYNAECOLOGY

Sir,—In the review of Professor Thomas H Cherry's book, *Gynecologic Technic*, which appeared in the *Journal* of July 12th (p 63) attention was called to the "excellent results in the treatment by diathermy of pelvic inflammation and chronic cervicitis" The concluding sentence of the review was, "In this country we have as yet had little success in this direction, and this detailed account of American methods might be of unusual value as a means of comparison and correction" This cannot be allowed to pass unchallenged

In the hands of Dr C Allen Robinson the method which he devised for subjecting the urethra, uterus, and its adnexa to diathermy has achieved success which surpasses that which Professor Cherry claims Beginning in 1919, in the electrical department of St Bartholomew's Hospital, Dr Robinson spent many months in designing various electrodes and submitting them to prolonged trial The

method which he eventually adopted has been employed by him for over ten years in my department at St Bartholomew's Hospital also at the West Middlesex Hospital and the London Clinic He has worked in conjunction with gynaecologists of distinction, and his results have been duly checked

I am familiar with the American methods and can point out certain defects in their electrodes and in the modes of using them These doubtless account for the relatively small proportion of successful results obtained by Professor Cherry in comparison with those procured by Dr Robin on The chapter on diathermy in *Gynecologic Technic* indicates that Professor Cherry has realized the great value of the method It also show that the work on diathermy in gynaecology in the United States has not progressed so far as it has in certain hospitals in this country —I am, etc,

London W 1 July 22nd E P CUMBERBATCH

ANAESTHETICS FOR SHORT OPERATIONS

SIR —Being single handed and beyond the reach of consultation I am naturally deeply interested in the matter of anaesthetics Having been trained in England I appreciate the comparative safety of ether over chloroform but on account of the ease and pleasure of being induced by the latter I have come to allow my raw assistants often to use it There are many pitfalls in the successful administration of chloroform however, but the question of the recumbent position has always been believed to be settled It is very disturbing therefore, to get a sudden unsupported statement, such as appears from Melbourne in the letter you published in your issue of May 31st (p 1023)—namely, that the idea that the recumbent position is the correct one to adopt during induction is incorrect"—followed lower by One of the most pleasant of all methods is chloroform induction to a patient sitting comfortably in an armchair"

No doubt some responsible anaesthetist will have something to say on the matter, but if not, I should be relieved to know if the writer, Dr R W Hornabrook, is speaking from wider experience than that of Melbourne —I am, etc,

United Methodist Mission, Wuting'u Shantung N China June 22nd. FRED R CRADDOCK

STORAGE OF X-RAY FILMS

SIR —The large number of letters and inquiries which I have received following the publication of my letter calling attention to the dangers of x-ray films serves to confirm my belief that conditions in radiological departments are far from satisfactory I am familiar with the recommendations referred to by Dr S Melville and published after the disaster in America, but I fail to see how these can give any measure of control for which I pleaded That they should be more widely known is of importance and I am confident, Sir that a useful purpose would be served if you were to republish them —I am, etc,

London W 1 July 25th. E J H ROTH

INTRAVENOUS SCLEROSING SOLUTIONS

SIR,—In the *Journal* of July 19th (p 120) Mr A H Winchester draws attention to some untoward symptoms after injecting sodium morrhuate Might I be permitted to add a brief note of a case of my own that I observed after writing the article to which he refers?

Untoward symptoms probably due to anaphylaxe developed in a young man aged 30 Several weeks previously he had received several injections of NaCl (20 per cent) into four sets of veins in the right leg I decided to inject two remaining veins with sodium morrhuate He belongs to a venous family on both sides The veins were congenital in type of moderate size and with no history of previous infection at any time but there caused him discomfort for which he sought treatment I gave an injection of 2 c cm sodium morrhuate (5 per cent) 1 c cm in the lower third of the leg followed by another 1 c cm into another vein below the knee Almost immediately after the last injection a diffuse blushing of the skin was noticed above and below the sites of the punctures accompanied by a slight stinging and tightening feeling the colour became more intense about the middle of the thigh and over the inner side of the ankle In the centre of the patch on the inner side of the thigh there suddenly appeared a cluster of six urticariform wheals about the size of small split peas Their appearance was preceded by local stinging and tingling and burning pain similar to that met with in herpes zoster Pain was also felt over the branches of the internal cutaneous nerve as far as the groin The whole leg was painful stiff and heavy The wheals persisted for about ten hours gradually fading and the pain lessened but was marked for a week The ultimate result was good the veins being cured but marked pigmentation of the skin over them developed

The conclusions drawn are that the solutions of sodium morrhuate are not entirely free from danger, as was first hoped, and that their field of usefulness in the treatment of veins may become restricted in the event of complications being noted in other cases —I am etc

London S W 7 July 26th T HENRY TREVES BARBER

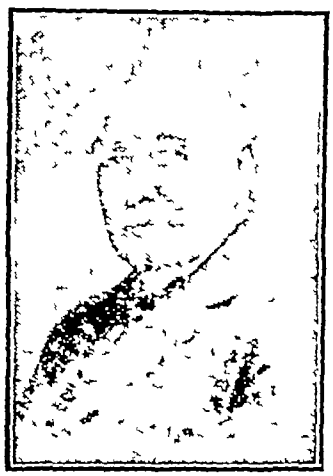
THE HARVEY CHURCH BELLS

SIR —I observe with much satisfaction that the Harveian Society of London is to assume the charge of reconditioning the church bells in Harley's burial place at Hempstead in Essex, and the moment seems opportune for an old change-ringer with much practical experience of casting and technical tuning to submit notes relating not only to the Hempstead bells but touching also a more general aspect of the subject

During a short visit to the church I was too much concerned with the Harley vault and the geological conditions associated with the fall of the church tower—a most singular event—to give the bells more than a passing glance These are five in number—one of them broken in the crushing collapse of the massive tower—and should be full and deep in pitch they are comparatively modern and not the long-waited castings of mediaeval times which may tempt many an ill-advised churchwarden to melt into an extra bell

In a district so remote and sparsely peopled as Hempstead there is no scope for change-ringing and since five-bell music is attractive and will give 120 changes I hope that those entrusted by the Harveian Society with this matter will see their way to re-erect the five-bell peal as it stood in former times With a good clock the four upper bells would give an excellent quarter chime leaving the tenor to strike the hour Attenuation in weight is unsatisfactory and apt to generate obscuring harmonics and even a sense of jingle Thus the famous Bow bells in the key of C are heavier and more satisfactory than those of Southwark Cathedral, which are a semitone lower in pitch Recasting moreover is no easy matter, and in spite of accurate measurements and imitation there is an element of uncertainty, or luck, in the issue, both in pitch and quality, which every bell-founder knows In such work an accurate ear is essential as well as that special endowment of touch to determine with certainty the precise zone or locality to be dealt with in tuning Bells abound in contrast, that singularly efficient raucous decrepitude Big Ben is known in every London household and by modern means is as audible at Madeira far down in the Atlantic as on the Thames Embankment while Great Paul, muffled in his chamber and murmuring his protest —Vae mihi si non evangelizavero —against any secular use, is hardly known to the average Londoner for whom the parliamentary impressive clock bell attracting vast multitudes to hear the New Year announced is the great bell of St Paul's Some day perhaps Great Paul a ton and more heavier than Big Ben audibly placed and adequately struck will easily suppress any other claim to the domination of the metropolis

I may not further transgress reasonable limit though my brethren will appreciate my subject matter but after all our training excludes nothing and in these days the 'doctor' is the trusted referee both in physical and general culture —I am, etc



Madeira July 15th. MICHAEL CRABHAM, M D LL D

Obituary

JOHN STEVENS, M.A., M.D., F.R.C.P.Ed.

Formerly Physician to the Edinburgh Western Dispensary

WE greatly regret to announce the death, which took place at his residence in Polwarth Terrace, Edinburgh, on July 24th, of Dr. John Stevens, a well-known practitioner of that city, and for many years an indefatigable worker in the British Medical Association. Dr. Stevens had been suffering from a prolonged illness which showed itself first when he was attending the Representative Meeting of the Association in Manchester a year ago.

John Stevens was born over seventy years ago near Bridge of Earn, and after graduating M.A. at the University of Edinburgh he proceeded to the study of medicine, where he had a distinguished course, gaining in addition to numerous class medals, the Sibbald medical scholarship, and the Stark scholarship. Graduating M.B., C.M. with first-class honours in 1884, he was awarded the Fettes scholarship, which is given to the most distinguished student of the year at Edinburgh University. In 1887 he proceeded to the degree of M.D., being awarded a gold medal for his thesis on "The tests for the bile salts and on the renal examination of the bile salts, urea, indican, and sugar, with a report of clinical cases." This was regarded as a valuable contribution to the side-room work carried out in connexion with clinical medicine of its time. After graduation Dr. Stevens acted as resident physician in the wards of the late Sir Douglas Maclagan at the Edinburgh Royal Infirmary, and had as three of his fellow residents Professor J. S. Haldane, Dr. James Hay Ferguson, and Sir David Wallace. Joining the Royal College of Physicians of Edinburgh as a Member in 1893, he proceeded to the Fellowship of this College in the following year. After a short period of post-graduate study at Vienna Dr. Stevens took up practice in Edinburgh, where in the course of over forty years he had become a well-known physician, greatly respected and beloved by friends and colleagues.

After joining the British Medical Association in 1892, he devoted a very large share of his time and energy to its various organizations, and the work of the Association may be said to have formed the principal hobby of his life. For many years he served as a member of the Executive Committee of the local Edinburgh Division, becoming its chairman in 1922. He became honorary secretary of the Edinburgh Branch in 1914, an office which he held till 1927, when he became its president. He attended every meeting of the Representative Body of the Association from 1914 till the year before his death, and served as a member of the Central Council from 1926 till his fatal illness rendered attendance at the meetings in London impossible. Among the Association's committees upon which he did good service were the Scottish Committee (1919–30), the Chairman's Subcommittee of the Scottish Committee (1923–24), the Medico-Political Committee (1919–27), the Medico-Political and Parliamentary Committee (1922–28), the Ethical Committee (1921–30), the Non-Panel Committee (1923–25), the Non-Panel Subcommittee (1923–24), the Committee *re* Insurance Acts Royal Commission (1924–25), and the Central Emergency Committee (1926–27).

At the time of the introduction of the National Health Insurance Act Dr. Stevens was one of its uncompromising opponents, and he was one of the organizers, and for a time treasurer, of the Medical Guild, an association of practitioners in Scotland who held aloof from the panels formed under the Insurance Act. Although he had latterly come to see that the Insurance Act had conferred many benefits both upon patients of the working class and upon medical practitioners, he maintained to the time of his death a vigorous opposition to any tendency towards the establishment of a State medical service.

The interment, which took place on July 28th, in Morningside Cemetery, was attended by a large gathering of professional colleagues and friends.

HUGH MILLER, M.B., Ch.B.Glas.

District Medical Officer, Department of Health for Scotland

WE have to record with deep regret the death of Dr. Hugh Miller, one of the best-known medical men in the West of Scotland which took place in Edinburgh on July 22nd. He was the youngest son of the late Rev. Thomas Miller of Neilston in Renfrew, and was born in 1877. He was educated at the High Schools of Ayr and Glasgow and graduated M.B., Ch.B. from Glasgow University in 1899. After holding resident posts in the Western Infirmary, Fever Hospital and Maternity Hospital Glasgow he underwent a course of post-graduate study in Berlin before settling down in Hamilton where he had a very large general practice. During the war he held the post of officer in charge of the Prisoners of War Hospital in Egypt with the rank of captain. About three years ago he was selected by the Scottish Board of Health and placed as regional medical officer for Dundee and district, an appointment which involved much hard work in travelling about the country.

Hugh Miller had always been a keen "B.M.A." man. In 1921–22 he was elected to the Central Council on which he served for six years. He was a member of the Scottish Committee, of which he became chairman in 1925–26 and during his period of office he was largely instrumental in bringing about the adoption of the modified scale of salaries for medical officers of health pertaining to Scotland. He had also served as a member on the Central Ethical, Central Emergency, and Psycho-analysis Committees of the Association. He served as temporary honorary secretary of the Lanarkshire Division in 1915, and was appointed secretary in 1919. He became a member of the Dundee Branch Council in 1930. He had been at one time honorary secretary of the Hamilton Local Medical and Panel Committee, and chairman of the Lanarkshire Medical Practitioners' Union. Before leaving Hamilton to take up his appointment under the Scottish Board of Health in 1927 he was entertained at dinner by his professional colleagues, who made him a presentation in recognition of his services in Hamilton.

Hugh Miller had all the qualifications for success. With a charm of presence and manner he combined a sound and skilful *flair* for practice and, accustomed as he was from his youth up to the exigencies of dealing with the sick and needy, success came naturally to him. His early death closes a career of great promise, and the sympathy of all his friends will be extended to Mrs. Miller, who was almost as well known as himself in representative gatherings of the Association.

The funeral took place on July 25th at the Morningside Cemetery, when the pall-bearers included Dr. J. Livingstone Loudon, representing the Central Council of the British Medical Association, and Dr. Thomson, representing the Lanarkshire Medical Practitioners' Union and the Hamilton Medical and Panel Committees. Dr. Miller's colleagues in the Department of Health, and his brother district medical officers, were also well represented. Dr. G. M. Miller, Dundee, of the Scottish Committee, was also one of the large gathering which assembled to pay a final tribute to a colleague whose high qualities and kindly disposition had won innumerable friends.

[The photograph reproduced is by Alex Ayton, Edinburgh.]

Dr WILLIAM CRAVEN ROCKLIFFE who died on June 23rd was the son of the late Dr Lunn of Hull he changed his surname to Rockliffe on succeeding to certain propert He was educated at Cambridge and St Thomas's Hospital obtaining the diplomas M R C S and L S A in 1876 He graduated M B Cantab in 1877, and proceeded M D Dub in the following year When a student at St Thomas's Hospital it is said that he used to drive up in a dogcart and pair or tandem throw his reins to the groom and then enter the portals of the institution He had intended to practise as a physician in Hull but took up ophthalmic work instead his father had previously undertaken most of the eye surgery in the district On the retirement of Dr Lunn as surgeon to the Hull Royal Infirmary he was appointed the first ophthalmic surgeon to that institution which position he held for twenty five years He was president of the East York and North Lincs Branch of the British Medical Association in 1894–95, and was the first president who provided champagne for all those at the annual dinner He held the office of vice president of the Ophthalmological Society 1900–3 he was a member of the council of the Ophthalmic Section of the Royal Society of Medicine 1917–18 and contributed numerous papers to ophthalmic and other medical journals A colleague writes Dr Rockliffe was a very hard worker at whatever he undertook He was a philanthropist and founded the Hull *Institution for the Blind which entailed his working for* many months every night until after twelve o'clock This institution has developed enormously and is now one of the great charitable organizations in Hull His name is perpetuated in the name of one branch—namely, The Rockliffe Home for Blind Women" He was a staunch Churchman and for several years acted as vicar's warden at Holy Trinity Church, during the incumbency of the late Canon McCormick When away from his professional work and that connected with the blind institution his recreations were shooting and gardening into each of which he entered with his characteristic zest He lost his right forefinger in a shooting accident this would have deterred most men from following ophthalmic work but it merely stimulated him to increased exertion and he very soon could operate as well as ever He was a very good dancer and pursued this pastime with his accustomed energy He played the cornet and some forty years ago organized a small amateur orchestra which for several years by means of concerts, provided substantial sums for the blind institution An exceedingly handsome man with a charming personality he endeared himself to all with whom he came in contact During the past few years owing to advancing age and cardiac trouble he lived in retirement but still worked in his garden and died peacefully in his chair after coming in from it He leaves a widow and one daughter

---

Dr H C CORDON MACKENZIE who died on July 18th was educated at Winchester and Magdalen College Oxford, and afterwards studied at Edinburgh and Newcastle He graduated M A Oxon in 1897 and M B Durh in 1907, proceeding to the M D in 1913 He was demonstrator in physiology at the Surgeons' Hall, Edinburgh in 1902–3 and served later as assistant tuberculosis officer and clinical assistant at Charing Cross Hospital and clinical assistant at the Brompton Hospital for Consumption and Diseases of the Chest He was much interested in the development of a scheme of medical control of boys' clubs and served for many years as honorary medical officer of the Hollington Boys' Club and of the Secondary Schools Camp Association During the war he was in command of the 83rd Field Ambulance of the Salonika Force with the rank of lieutenant-colonel R A M C (T F) and was awarded the D S O Dr Mackenzie was a member of the Chelsea Division of the British Medical Association

---

Dr JOHN POPPER PARKINSON died on July 11th at his home in Eastbourne where he had lived for the past few years in retiring from active practice in London He was born in 1863, and from Shrewsbury School went to study medicine at University College London graduating M B Lond in 1888 and qualifying for the gold medal at the M D examination next year He then served for twelve months as house-physician house-surgeon and obstetric assistant at University College Hospital and having obtained the F R C S was appointed demonstrator of anatomy at University College After a short period on the staff of the Mount Vernon Hospital he was admitted M R C P and from 1895 to 1898 served as medical registrar to the Westminster Hospital and clinical assistant at Great Ormond Street His next appointments were to the medical staff of the London Temperance Hospital and the Queen's Hospital for Children, with which institutions he remained associated until his retirement when he was elected consulting physician He was also consulting physician to the Finchley Memorial Hospital Dr Porter Parkinson contributed a number of papers mainly on diseases in childhood to medical journals and was the author of a small book on the *Diagnosis of Diseases* which appeared in 1898 He had been honorary secretary of the Society for the Study of Diseases of Children and after the amalgamation he held office as president of the corresponding section of the Royal Society of Medicine He was elected F R C P in 1923

Dr FREDERIC WILLIAM DANIELS who died on July 20th at Leicester where he had resided since 1927 was born in 1872 and received his medical education at the London Hospital He obtained the diplomas M R C S L R C P in 1904 and became F R C S in the following year He held various house appointments at the London Hospital and then practised in Newport Monmouthshire, where he was medical officer to the out-patients and the electrical department of the Royal Gwent Hospital During the war he held a commission in the R A M C

Medical Notes in Parliament

[FROM OUR PARLIAMENTARY CORRESPONDENT]

THE week has been the last of the Parliamentary Session which began on July 2nd 1929 Before the *prorogation both* Houses were occupied in adjusting differences on the Road Traffic Bill Housing Bill and other measures which thereafter awaited the Royal Assent The House of Commons passed the outstanding Estimates of the year and discussed foreign affairs and the Army

In the House of Lords on July 29th, the Housing (Scotland) Bill passed its final stage

---

Small pox—Mr GREENWOOD on July 29th told Mr Groves that in 19 of the 39 deaths registered in England and Wales during 1929 and classified to small pox one cause of death in addition to small pox appeared on the death certificate The 19 deaths were those of the persons shown in the table contained in his reply given to Mr Groves on July 21st

Shortage of Medical Officers in the Services—On July 29th Mr SANDERS told Dr Vernon Davies that the present shortage of regular Royal Army Medical Corps officers was approximately 1-9 The Secretary for War was in consultation with the Army Medical Advisory Board as to the causes of this shortage and the possible remedies On the same day Mr AMMON told Dr Vernon Davies that the shortage of naval medical officers still continued There were no signs of more satisfactory recruitment The *question was under consideration by the Admiralty* Mr MONTAGUE also informed Dr Davies that there was still some difficulty in obtaining the numbers of medical officers required The question was constantly engaging the attention of the medical authorities at the Air Ministry and of the Air Council

British Trade with India in Medicinal Goods—On July 22nd Mr BENN answering Sir Graham White and Lieut-Col Applin in medicines tatives of the volume of British trade with India in medicines and medical appliances He was informed in April last that a boycott of these classes of British goods had been established in consequence of the decision of the General Medical Council in consequence of the decision of the General Medical Council in May he had the recognition of Indian medical degrees but in May he had the recognition of Indian medical degrees but in March last reports that this boycott was weakening and that orders for British goods were being placed He had received further reports

Tenure of Health Appointments—On July 22nd Mr JOHNSTON in reply to Mr Mac[illegible] a statement as to officers of county and town councils in Scotland who are removable from office [illegible] or with the consent of the court or a Government [illegible] The offices included medical officers of health sanitary [illegible] medical practitioners in the Highlands and Islands [illegible] the county council for the purposes of the duties of [illegible] a police authority [illegible]

medical officers of poorhouses medical superintendents of sanatoriums, public analysts, veterinary inspectors, and medical superintendents of certified institutions for mental defectives

Research on Poison Gas—On July 29th Mr SANDERS told Mr Freeman that the Secretary for War was definitely advised by his expert advisors that the results of the experiments conducted at Porton and elsewhere with poison gases on living animals were such as to leave no doubt that the methods of curative treatment of the effects of gas which those experiments suggested were applicable to human beings

Notes in Brief

In answer to Dr Vernon Davies on July 23rd, Mr Lansbury stated that the Serpentine was last cleaned out during the years 1869, 1870, and 1871

Mr Greenwood states that 265 centres for the purpose of artificial sunray treatment were approved by his department up to April 1st last

The number of buildings acquired by local authorities in England and Wales since April 1st, 1925 in connexion with approved slum clearance schemes is approximately 10,700 and the number demolished approximately 9 000 The number of new dwellings erected is rather more than 9 700

ROYAL COLLEGE OF SURGEONS IN IRELAND

Carmichael Prize Essay

THE late Richard Carmichael, having bequeathed to the College a sum of money for the purpose of founding prizes for essays upon certain subjects specified by him, the President and Council give notice that, on the second Thursday in November 1931, they will proceed to adjudge prizes of £150 and £100 for the best essays that may be presented to them, in accordance with the following instructions prescribed by Mr Carmichael (1) "The state of the medical profession in its different departments of physic, surgery, and pharmacy, in Great Britain and Ireland, at the time of the writing of these prize essays (2) The state of the hospitals and schools of medicine, surgery, and pharmacy" (3) "The state and mode of examination, or of testing the qualifications of candidates of the different licensing colleges or corporations of medicine, surgery, and pharmacy

The Services

AN R A M C MUSEUM AT CHELSEA

A MUSEUM, which also serves the purpose of library and study centre has been established at the Duke of York's Head quarters, Chelsea for the use of the officers and men of the Royal Army Medical Corps, 47th (2nd London) Division, T A It consists at present of only one room though there is every sign that it will soon overflow into others but it has been pleasantly furnished and equipped with a number of interesting and educative objects

The museum was opened on July 26th by Lieut-General H B Fawcus, C B, Director General Army Medical Services, who explained that the idea originated in the mind of the curator, Captain H A C Gregory who wished to improve the educational standard of the R A M C recruit, and considered that, in order to get a proper grasp of the subjects in his curriculum, a man needed not only his manual, but recourse to models, specimens, slides, and the like Captain Gregory therefore approached Colonel L D Bailey and the other R A M C officers of the Division, who encouraged the project by every means in their power and help was enlisted from many quarters, including the County of London Territorial Army Association and the Royal Army Medical College at Millbank General Fawcus highly praised the conception and expressed the hope that the museum would more than fulfil the ambitions of its promoters Colonel Bailey stated that it was the intention to have weekly lectures in the museum by specialists in their respective subjects, and the museum would be open every day for the use of officers non-commissioned officers, and men, it was hoped to make it in time a thoroughly equipped school of instruction He mentioned some of those

to whom special thanks were due for gifts and loans—first of all, Captain and Mrs. Cregoe, who donations had been most generous. The Royal Army Medical College had furnished an excellent series of anatomical and pathological specimens, St. George's Hospital another set. Professor J. E. Frazer a life-size atlas, the 8th Hygiene Company a set of sanitary models. Sir Cuthbert Wallace (*the hon. rank colonel*) a microscope and set of slides while various officers had to be thanked for exhibits and books. The museum contains an epidiascope and is arranged with desks and every convenience for study. Two life-size figures from Tussaud's collection form a striking embellishment. One of them represents a private in the uniform of the old Hospital Corps of 1856 carrying a knapsack the purpose of which is obscure; the other is an R.A.M.C. orderly of to-day holding a Thomas splint. The models for the two figures are two celebrated association footballers.

DEATHS IN THE SERVICES

Lieut.-Colonel George Henry Bell, R.M.A., Medical Service (*retd.*) of Monte Carlo and of the Badminton Club, died in a nursing home in London after a short illness on July 11th. He was born on July 23rd, 1852, the son of Joshua Bell of Cork, was educated at Queen's College, Cork, and graduated as M.D. and M.Ch. in the Queen's University of Ireland in 1877. Entering the I.M.S. as surgeon on March 20th, 1878, he became lieutenant-colonel after twenty years' service, was placed on the selected list for promotion on April 12th, 1903, and retired on June 30th, 1908. He served in the Burma campaigns from 1885 to 1889 and received the frontier medal with two clasps, and in the Sudan in the Dongola campaign of 1896 receiving the Egyptian medal and the Khedive's medal. He rejoined for service in November, 1914, served in the Pavilion hospital for Indian troops at Brighton till it was closed early in 1916, and afterward in various other posts in England till the end of the war. He was granted a Good Service Pension on May 24th, 1922.

Lieut.-Colonel Clarence Forbes Fearnside, Madras Medical Service (*retd.*), died at Vancouver on June 29th, aged 66. He was born on February 28th, 1864, the son of John Fearnside of Aberdeen, and was educated in the University of that city, where he graduated as M.A. in 1886, and as M.B. and C.M. in 1889. Entering the I.M.S. as surgeon on March 31st, 1892, he became lieutenant-colonel after twenty years' service and retired on September 10th, 1912. He served in the Chin Hills campaign in 1892-93 on the North-East Frontier of India, gaining the frontier medal with a clasp, and also rejoined for service in the war of 1914-18.

The death was recently announced of Lance-Corporal Joseph John Farmer of the Army Hospital Corps, who received the Victoria Cross for gallantry in the action at Majuba in the first Boer war. The *London Gazette* of May 16th, 1881, announces the grant of the Cross as follows:

> For conspicuous bravery during the engagement with the Boers at the Majuba mountain on the 27th February, 1881, when he showed a spirit of self-abnegation and an example of cool courage which cannot be too highly commended. While the Boer closed with the British troop near the Well, Corporal Farmer held a white flag over the wounded and when the arm holding the flag was shot through he called out that he had another. He then raised the flag with the other arm and continued to do so until that also was pierced with a bullet.

Medical News.

THE annual Neech Prize of the Society of Medical Officers of Health for the best paper read before a branch or group of the society, has been awarded for the session 1928-29 to Dr. J. Sim Wallace for his address on "The prevention of dental caries" published in *Public Health*, February, 1929. The award has been delayed to allow publication of all the papers submitted for consideration by the assessors.

THE Fellowship of Medicine announces that an afternoon and evening course comprising clinical and cystoscopic demonstrations will be given at All Saints Hospital, Vauxhall Bridge Road, from August 5th to 30th. A comprehensive course in diseases of the chest will be held at the Brompton Hospital from August 11th to 16th, when instruction will be given throughout the day in the various departments. Courses in the following month will include one in diseases of children at the Queen's Hospital from September 1st to 13th, and another in medicine, surgery, and the specialties at Westminster Hospital from September 15th to 27th. Post-graduates are invited to apply to the Fellowship of Medicine for copies of the syllabuses of the above courses, and also for the programme of work for the winter months. The provisional list of special courses for 1931 is now ready.

MR. L. G. BROFF, chairman of the Board of Control, will officially open the new Coleshill Hall Certified Institution for Mental Defectives, Birmingham, on Tuesday, September 16th, at 3 p.m.

THE eleventh International Veterinary Congress will be held in the Central Hall, Westminster, from August 3rd to 9th. On the evening of Sunday, August 3rd, the president, Sir John McFadyean, and members of the organizing committee will hold a reception at the May Fair Hotel. Other evening functions include a conversazione by the Royal College of Veterinary Surgeons, a banquet given by the Government to official delegates, a reception by the Lord Mayor and Corporation at the Guildhall, and the official banquet of the Congress at the Connaught Rooms. The programme of the sessions includes a number of subjects closely related to human medicine. The office of the organizing committee is at 10, Red Lion Square, W.C.1.

THE Minister of Health has addressed to local authorities a number of suggestions relating to the preparation of by-laws under the Public Health Act, 1925, and proposals outlined in paragraph 6 of the memorandum contained in the report to the Local Government Departmental Committee on Housing (England and Wales), published on February 4th, 1930, (Cmd. 3608), and recommendations of the Committee on Rating of Machinery, published on February 6th, 1930, (Cmd. 3614). Provision is made for, among other purposes, under the ground floor throughout the whole of a new building, or in existing buildings, except in certain cases, the by-laws shall require top and any ventilating aperture so as to prevent the free passage of gas into the building; (*b*) that geysers shall be properly fixed and adjusted, and that both the apparatus and the room in which the apparatus is fixed shall be adequately and efficiently ventilated. It should be made unlawful to install or maintain a geyser without a proper flue. Model clauses are given in the circular to assist local authorities in framing their proposals.

DR. ARTHUR HAYNARD has accepted the invitation of the local Liberal party to become Lord Mayor of Leeds. Under an agreement existing between the three parties on the City Council it is the turn of the Liberals to nominate a candidate for the next municipal year.

SIR JOHN COLLIE, the London County Council [illegible] examiner, has tendered his resignation with effect from February 15th next. He was appointed to the post in 1903. The appointment is a part-time one and remunerated by fees on a capitation basis.

ON July 13th a tablet in memory of Sir William Osler was unveiled at Ewelme Church by the Bishop of Oxford. As Regius Professor of Medicine in the University of Oxford Osler was Master of the Ewelme Almshouse, and whenever he could find time he loved to visit this secluded and picturesque spot. He had its mouldy old records cleaned, bound, and preserved in a fire-proof safe in the muniment room. The tablet commemorates also Lady Osler and their son Revere.

THE Cambridge University Press announces for early publication the third volume of Professor Karl Pearson's *Life, Letters and Labours of Francis Galton*. Volume IIIa deals with Correlation, personal identification, and eugenics; volume IIIb with Characterization, especially by letters.

SHORT but useful accounts of the incidence and treatment of leprosy in Ceylon and the hills of Assam are published in the July number of the *Leprosy Review*, which is the quarterly publication of the British Empire Leprosy Relief Association. Practical points of treatment are indicated in five other articles, mention being made in one of the use of 2 per cent. and 6 per cent. alepol solutions in Persia, where hope is expressed that the disease may be eradicated in a decade or two since very few of the lepers are really Persians by birth. Some useful hints are supplied by the Rev. F. W. Poss as regards the conduct of an Indian treatment centre, and other articles relate to diagnosis, classification, and prophylaxis. The July issue of *Without the Camp*, the quarterly magazine of the Mission to Lepers, comments on the progress of leper treatment centres, particularly in China and India. The Mission has obtained new offices at 7, Bloomsbury Square, W.C.1, to which address all communications should be sent.

As we go to press we learn with deep regret of the death on July 30th of Sir Francis Champneys, [illegible] physician to St. Bartholomew's. He [illegible] chairman of the Central Midwives Board at the age of 82. An obituary notice will appear in an early issue of the *Lancet*. The funeral will take place at Hampstead [illegible] there will also be a [illegible] at 8.30 a.m. on that day, [illegible] service at 10 o'clock.

Letters, Notes, and Answers.

All communications in regard to editorial business should be addressed to ***The EDITOR, British Medical Journal, British Medical Association House, Tavistock Square, W C 1***

ORIGINAL ARTICLES and LETTERS forwarded for publication are understood to be offered to the *British Medical Journal* alone unless the contrary be stated Correspondents who wish notice to be taken of their communications should authenticate them with their names not necessarily for publication

Authors desiring REPRINTS of their articles published in the *British Medical Journal* must communicate with the Financial Secretary and Business Manager British Medical Association House, Tavistock Square, W C 1, on receipt of proofs

All communications with reference to ADVERTISEMENTS as well as orders for copies of the *Journal* should be addressed to the Financial Secretary and Business Manager

The ***TELEPHONE NUMBERS*** of the British Medical Association and the *British Medical Journal* are *MUSEUM 9861, 9862, 9863, and 9864* (internal exchange four lines)

The ***TELEGRAPHIC ADDRESSES*** are

EDITOR OF THE *BRITISH MEDICAL JOURNAL, Aitiology Westcent London*

FINANCIAL SECRETARY AND BUSINESS MANAGER (Advertisements, etc) *Articulate Westcent London*

MEDICAL SECRETARY *Medisecra Westcent London*

The address of the Irish Office of the British Medical Association is 16 South Frederick Street, Dublin (telegrams *Bacillus, Dublin* telephone 62550 Dublin), and of the Scottish Office 7, Drumsheugh Gardens Edinburgh (telegrams *Associate, Edinburgh*, telephone 24361 Edinburgh)

QUERIES AND ANSWERS

DERMATITIS HERPETIFORMIS

DR J E RICHMOND (Liverpool) writes I should be grateful if someone would suggest some form of treatment which has been tried with success, for a case of dermatitis herpetiformis I cite a case of a young man, aged 30 *Duration of disease, one year* The usual treatment has been tried

TREATMENT OF ASTHMA

"W" writes I would be glad to know if any of your readers have tried Dr Paul Cantonnet's treatment of asthma, and with what results? Is there any translation of his paper available in English? The pamphlet I have is entitled 'Traitement curatif de l'Asthme' Par Docteur Paul Cantonnet Communiqué à l'Academie de Médecine le 22 Février 1929 Deuxième édition Norbert Maloine, 22, Rue de l'Ecole de Medecine, Paris 1929

COLOUR BLINDNESS

"A B" writes I should be glad if any of your readers could give information regarding colour blindness (especially red) Is there any treatment? What professions or trades are suitable? Is the medical profession unsuitable? What literature can be consulted, especially as to career?

KEEPING FIT IN HOT CLIMATES

DR E J BALL (Clifton) writes in reply to C H B (July 26th p 168) Try hot tea In the old sailing ship days my father was seven years on end in one commission on the Gold Coast, etc Three doctors in his ship died in succession and on one occasion he was one of about a dozen in his ship's company of 180 men who did not get yellow fever The doctors, he told me drank spirits and used to laugh at him for drinking hot tea But the tea induced perspiration, and he lived while they died He was not a teetotaller

CLEANSING OF THE CHALICE

THE VEN BERESFORD POTTER, M A, sometime Archdeacon in Cyprus and Syria, writes I see in your issue of July 26th two observations by 'Medicus' and R concerning the cleansing of the chalice in the Holy Communion service This matter was discussed at the last Lambeth Conference and a leading bishop, I understand, reported that the best way of meeting the difficulty was the adoption of intinction Nothing however, was finally settled, but in the proposed prayer book of 1927 (p 283) the following words were used When it is desirable to administer both kinds together the words of administration shall be said thus, etc, and the note was added 'that the same order shall be observed with the permission of the bishop when it is deemed necessary, through grave danger of infection, to administer both kinds together at the open communion Although this prayer book has not received the approval of Parliament, there is not the slightest doubt that no objection could or would be made by Parliament to action suggested by this proposal of the bishops and Church Assembly This I know from a leading opponent of the new prayer book Many clergy have already agreed to offer intinction at the open communion to any communicant desiring it This can be arranged by such communicants kneeling at the extreme end of the altar rails, and the bread or wafer dipped in the wine while administering to them The priest would then continue to administer to the remaining communicants in the accustomed way It should be observed that on and after the Council of Clermont A D 1095, Pope Urban the Second agreed to the custom of dipping the bread in the wine when there was any danger of spilling the wine and also in administering to the sick In A D 1414-18 the Council of Constance forbade communion in both kinds It was not until A D 1547 that the present undesirable practice, which a great number of leading medical men now condemn, especially in large centres of population, was introduced by Archbishop Cranmer *I understand that a considerable number of people* in the English Church failing an arrangement for intinction, receive only in one kind

DR FREDERIC SANDERS writes on this subject My grandfather always attended church thrice on Sundays my father (a doctor) twice, myself usually once, but unless the abominable and disgusting practice at present obtaining in the communion service is changed, I shall do what I can to prevent my son attending at all

LETTERS NOTES ETC.

THE MEDICAL DIRECTORY"

MESSRS J AND A CHURCHILL (40 Gloucester Place Portman Square, W 1) write The annual circular for the *Medical Directory* has been posted to each member of the medical profession If the form has not been received a duplicate will be sent on request We shall be grateful for the return of the forms by an early post

THE BOOT AND THE SHOE

MR JOHN HOWE (general secretary of the Boot Trades Associations, Ltd) writes The leading article in the *Journal* of July 5th on 'The foot and the shoe' has greatly encouraged us in our efforts to achieve some form of agreement in the trade upon what constitutes healthy footwear We particularly wish to *second the interest of the medical profession in our attempt to* bring home to the public the value of sound footwear as an aid to lessening foot troubles and the risk of illnesses which arise from damp feet The boot and shoe trade has spent many months on research work and has sought the advice of many authorities in its endeavours to collect data useful to the trade The human foot has been classified into certain types, and this classification has been made available to manufacturers with a view to helping them to replace obsolete methods of "fittings Special instruments have been devised which enable the category of a foot to be immediately determined and the appropriate type of shoe selected I may mention as evidence of the desire of our Federation to improve footwear along correct lines, that we have had the benefit of the honorary advisory services of an orthopaedic surgeon who, in lectures and by personal advice, has given our members a better knowledge of the anatomy of the *foot in relation to the construction of lasts* It will therefore be seen that the trade is doing its best to encourage the manufacture and use of sensible footwear, and it would appreciate nothing more than the endorsement of the medical profession

DELAYED GROWTH IN HEIGHT

DR D I CONNOLLY (Sale) writes The following case of delayed growth in height occurring after the age of 30 years might *I thought, be of interest A lady aged 30 years, consulted* me some two months ago about dizziness, nausea and malaise I ordered rest in bed and strictly fluid diet Jaundice of an obstructive type intervened, and I gave her small doses of calomel and a bismuth mixture She stayed in bed six days and all the symptoms gradually cleared up When she got out of bed both her husband and she were astonished to notice that she seemed appreciably taller Measurements were taken and checked and it was found that she had grown 1½ in in height during the six days in bed A fortnight later she was measured again and she had grown another 1/2 in, again checked This was about five weeks ago Since then she has remained stationary in height She now measures 5 ft 6 in She has one brother younger than herself and two sisters older, and all of them are 6ft 1 in in height To many of us I feel sure this case will be unusual I have not looked up the literature on the subject Perhaps some of your correspondents could throw light on the matter?

INFECTED EGGS

DR E F WILLIS (Rendlesham Hall, Woodbridge) writes In the *British Medical Journal* of July 12th (p 56) Dr Scott gives a very illuminating account of infection conveyed by ducks' eggs The mode of infection of the eggs is said to be *in utero* May I suggest a second mode of infection that is just possible In hot countries eggs are kept covered from biting flies, as several kinds can pierce the shell and so contaminate the contents I have seen a mosquito pierce the shell of a chicken's egg, and such eggs go bad, as the shell is no longer whole Ditches produce several kinds of biting insects, and it seems quite possible that infection would be conveyed in this way I had a section of a mosquito's head and proboscis showing in the proboscis and travelling toward the tip, a pair of filariae, these would be injected into the victim first bitten and a whole cycle of filariasis started in the body of it Would it be possible for ducks' eggs to be infected in this way by some poisonous gnat?

VACANCIES

NOTIFICATIONS of offices vacant in universities, medical colleges, and of vacant resident and other appointments at hospitals, will be found at pages 32, 33, 34 35, 38 39 and 40 of our advertisement columns, and advertisements as to partnerships, assistantships, and locumtenencies at pages 36 and 37

A short summary of vacant posts notified in the advertisement columns appears in the *Supplement* at page 95

EPITOME OF CURRENT MEDICAL LITERATURE.

Medicine.

95 Syncope associated with Hypersensitivity of the Carotid Sinus

J ROSKAM (*Presse Méd*, April 30th, 1930 p 590) refers to the well established fact that pressure applied to the neck in the vagus region causes bradycardia Hering has shown that this phenomenon is not due to vagal stimulation, but to a reflex originating in the carotid sinus, which lies at and above the level of the bifurcation of the common carotid artery This plexus controls the vagal tone, and therefore also the heart rate and blood pressure In patients suffering from arterio sclerosis and hypertension the reflex slowing of the pulse following pressure over the sinus is particularly well marked, but ill effects other than giddiness or faintness are rare The author describes a patient in whom there appeared to be an extreme and chronic hypersensitivity of the carotid sinus A man, aged 53, complained of fainting attacks resulting from accidental pressure on the neck On examination the heart was found to be regular and not enlarged the sounds were normal, and the blood pressure was 175/90. Pressure at various points on the left side of the neck produced no result except at the carotid sinus half way between the thyroid cartilage and the angle of the jaw The patient then lost consciousness, respiration ceased, and he became pulseless After fifteen seconds epileptiform convulsions appeared, and the heart began to beat at 120 per minute, with frequent extrasystoles Similar phenomena were evoked by very light pressure upon the opposite side of the neck at a corresponding point The electrocardiogram was normal, and *x* ray examination showed no enlargement of the heart, but advanced aortitis Subsequently further attacks were provoked by transient and by prolonged elevations of blood pressure The author urges that the sensitivity of the sino-carotid reflex should be determined prior to all operations on the antero-lateral region of the neck especially since chloroform causes an exaggeration of the reflex

96 Herpes Zoster in Lethargic Encephalitis.

A. NETTER (*Bull et Mém Soc Méd Hôp de Paris*, May 19th, 1930, p 793) has collected 16 cases of zoster connected with lethargic encephalitis, In 4 of these the eruption was simultaneous with the onset of encephalitis, and in 10 it was a subsequent event, the interval ranging from a week to five years The presence (demonstrated by G Guizetti) in more than a quarter of the necropsies on cases of encephalitis of lesions of the spinal and cerebral ganglia accounts for the appearance of the zoster, and explains its bilateral distribution in a fifth of Netter's cases, as well as the almost constant presence of neuralgic pains and myoclonus On the other hand, the rarity of zoster in encephalitis suggests that the part played by encephalitis in its production is merely limited to preparation of the nerve area which is attacked by the specific agent The intervention of this agent has been established by the reaction of fixation, Bedson having shown the presence of the zoster antigen in the cerebro-spinal fluid of a patient suffering from encephalitis and zoster In three cases the intervention of varicella was shown by the development of this eruptive fever in subjects who had been in contact with the patients, thus furnishing a further argument in favour of the view held by Netter and Urbain of the identity of origin of the varicella and zoster virus P HOMBOURGER (*Ibid*, p 791) also records a case in a man, aged 30, in which intercostal zoster was concurrent with a paraplegic form of epidemic neuraxitis

97 Spontaneous Pneumothorax in Influenza

W WOLLENWEBER (*Arch f Kinderheilk*, May 24th, 1930, p 222) records four fatal cases in children aged 3 months, 6 months, 1½ and 3½ years respectively, in whom the most striking symptoms were sudden aggravation of the general condition, intense dyspnoea and an anxious expression resembling that of patients suffering from severe diphtheria stenosis The necropsy revealed a rupture of a small subpleural abscess, which had either immediately caused a fatal pneumothorax or had led first to the formation of an empyema and then to escape of air into the pleural cavity by a secondary communication of the abscess cavity with the bronchial tree. Unlike pneumothorax in children without severe pulmonary changes, the prognosis of spontaneous pneumothorax in influenza is extremely unfavourable, since a necessary condition for its occurrence is the presence of suppurative pneumonia

98 Chronic Meningococcal Septicaemia

H VESELL and J BARSKY (*Amer Journ Med Sci* May, 1930, p 589), who record a fatal case in a woman, aged 43, state that chronic meningococcal septicaemia, or chronic meningococcaemia, was first described in 1902 by Soloman Its rarity is probably more apparent than real It is characterized by a rather sudden onset with headache intermittent fever, joint symptoms, and a typical eruption resembling erythema multiforme which consists of crops of firm, tender, slightly raised red to bluish red nodules Prostration is slight, but the condition lasts for two to three months The prognosis is better than that of other septicaemias. Meningitis is absent in a large number of cases when it does occur it is a late development Early diagnosis is difficult because the blood culture is frequently sterile until late in the disease Treatment consists in the intravenous injection of antimeningococcal serum, in 20 to 40 c cm doses given every twelve hours, according to the patient's condition

99 Adenoiditis as a Complication of Measles

J CAMINIS (*Arch de Méd des Enf*, April, 1930, p 231) records his observations on seven cases of acute adenoiditis which occurred during a recent epidemic of measles in the Greek island of Chios Rapid recovery followed instillations of gomenol oil into the nasopharynx The complication which occurred in children who were the subject of adenoids developed either at the height of the disease or after the eruption had faded

100 Prophylaxis of Rickets.

A. G DE SANCTIS and J D CRAIG (*Journ Amer Med Assoc*, April 26th, 1930, p 1285) made comparative observations on the value of viosterol (irradiated ergosterol) and cod liver oil as prophylactic antirachitic agents with the following results Cod liver oil in doses of three teaspoonfuls daily prevented rickets in 97 out of 103 infants studied On the other hand, viosterol D in doses of 10 drops daily prevented rickets in only 77 per cent out of 123 cases Viosterol, therefore, is less effective in the prevention of rickets than cod liver oil, although the infants on viosterol received about twice as many rat-units of vitamin D as those on cod liver oil The authors think that one of two conclusions may consequently be drawn either the present recommended dose of viosterol is too small to prevent rickets, or, as seems more likely to them rickets is not due to a deficiency of vitamin D alone

Surgery.

101 Suppurative Abscess of the Lung.

H GABRIELLE (*Lyon Chir*, March–April, 1930, p 225) reports a case of suppurative abscess of the left lung treated by phrenicectomy and extrapleural thoracectomy This type of abscess and its recognition have become much more frequent during the last few years, due partly to radiography, which helps diagnosis, and partly to the severe influenza epidemic of 1918, which was accompanied by numerous cases of lung abscess The use of poison gas during the war has rendered pulmonary abscesses more common In America they have increased in number to a remarkable degree, and it has been suggested that they most frequently follow some surgical operation on the jaw, tongue, and pharynx, or for gastric ulcer The pathology of these abscesses appears to have changed from the simple acute type due to bacterial infection, such as pneumococcal, staphylococcal, streptococcal, or the bacillus of Friedländer, to a type which may be called "gangrenous abscesses", this now appears to be the most common These foul-smelling abscesses are nearly always primary, and may occur at the onset of or in the course of, an ill defined congestion of the lung without a noticeable rise in temperature, or even during a simple bronchitis. The initial symptoms may be slight, and the attention is first attracted by the fetidity and violence of expectoration The physical signs are variable and radiography is the most valuable aid in diagnosis although the appearance may vary from day to day according to whether the cavity is full or empty this form of examination must therefore be repeated. Microscopical examination of the pus shows it to be rich in microbic flora. The clinical symptoms are a hard painful cough and abundant fetid expectoration which is sometimes accompanied by vomiting while the patient has

the appearance of one suffering from phthisis Repeated examination shows the progressive extension of the pulmonary lesions Medical treatment alone is insufficient, and surgical treatment, such as phrenicectomy followed by extrapleural thoracoplasty, is safer, it gives the best results, though, even when the patient has apparently recovered, great care must be taken to avoid a recrudescence of the trouble, since the adjacent pulmonary lesions persist for some time

102 Primary Congenital Dilatation of the Ureters

O PEPI (*Il Policlinico*, Sez Chir , April 15th, 1930, p 183), who records three illustrative cases in patients aged 40 years, 11 months, and 2 years respectively, states that primary congenital dilatation of the upper urinary tract is a fairly rare condition The lesion may involve the whole of the excretory tract, or, more frequently, only segments of it As a general rule the dystrophy is revealed by the occurrence of a complication The congenital lesion primarily affects the nerve fibres, giving rise to atony, and subsequently to dilatation of the renal pelvis and ureters The diagnosis is usually rendered possible by cystopyelography A remarkable feature in Pepi's adult case, in which the symptom was repeated haematuria, was that the lesions were bilateral, as was discovered by cystopyelography No operation was performed, and the patient was discharged after washing out the renal pelvis with silver nitrate solution In the other two cases the condition was not found until the necropsy

103 Bone-block Operation for Drop-foot

W C CAMPBELL (*Journ of Bone and Joint Surg* , April, 1930, p 317), who deprecates the unsatisfactory operative measures used in the treatment of drop foot, describes a surgical procedure devised in 1922 which has been used in over 300 cases The object of the operation is to construct, posteriorly to the ankle joint, an osseous process, attached to the os calcis and impinging upon the articular and the posterior surface of the tibia, blocking ankle motion at about 10 degrees of plantar flexion The indications for the operation are simple drop foot, partial loss of function in the anterior group of muscles, rigid equinus in which the anterior group of muscles is paralysed, equino varus with paralysis of the extensor muscles, equino valgus when associated with decrease in function of the anterior group of muscles, flail foot with complete loss of muscle power, as an adjunct to the transference of various tendons, and for spastic spinal paralysis with overactivity of various tendons The operation should not be employed in the case of children under the age of 8 The clinical results in 225 cases showed that bone block was efficient in 211 cases, radiographic examinations of 143 cases revealed well developed osseous process in all but ten cases In no instance has subsequent arthritis been observed

104 Haemangioma of the Small Intestine

A KORTZEBORN (*Zentralbl f Chir* , April 26th, 1930 p 1042), who records an illustrative case, states that intestinal haemangioma is unusual even as a post-mortem finding, while haemangioma of the small intestine which has come to operation is extraordinarily rare Only two previous cases indexed have been recorded in which haemangioma of the small intestine has been operated on successfully The first case was that of Rodelelius, the operation being for intestinal obstruction , the second case was recorded by Landois, who during an appendicectomy found a haemangioma of the small intestine, which he removed to prevent intestinal obstruction or haemorrhage Kortzeborn's patient was a man, aged 41, who had suffered for seven years from attacks of intestinal haemorrhage and occasional colicky pains On laparotomy a tumour of the size of an apricot was found in the small intestine 75 cm from the ileo caecal junction The affected part of the gut was resected and complete recovery followed

105 The Treatment of Gastro-duodenal Haemorrhage.

H LEFÈVRE and P BROUSSET (*Journ de Med de Bordeaux*, May 10th, 1930, p 355) emphasize the necessity of reaching a diagnosis quickly in gastro duodenal haemorrhage, in order to apply the appropriate treatment Haemorrhages due to ulcer may be solitary, repeated, or continuous, in 30 to 40 per cent of cases of such gastric bleeding the issue is fatal, and early operation is advised Patients blanched by haemorrhage, or with a red corpuscle count of 2 million or under, cannot stand an operation when it reaches 3 million and over the risks of operation are said to be no greater than if time is spent in improving the general condition The authors believe that the risks of operation are less than those of adopting a waiting policy

Therapeutics.

106 Ephedrine in Oto-rhino-laryngology

LI MIT (*Arch Internat de Laryngol* , February, 1930, p 234) describes the pharmacology and uses of ephedrine, the drug is obtained from a plant or prepared synthetically, the synthetic product being optically inactive, and much feebler in its action than the optically active natural drug Ephedrine acts in much the same way as adrenaline It stimulates the sympathetic system, producing vaso constriction and a rise of blood pressure, the action is, however not so marked on the blood vessels as is that of adrenaline, a nasal mucosa which has been treated with ephedrine remaining pink, in contrast with the greyish colour found after adrenaline The advantages of ephedrine are the absence of vaso dilatation after the effect of the drug has passed off, in addition, a much longer period of ischaemia is obtained than with adrenaline The author finds that the chloride is the most active salt, but that the sulphate is better tolerated by the mucosa A solution of 2 to 3 per cent is used in nasal work, and in combination with cocaine or novocain for work under local anaesthesia If used with novocain for injection the natural product must be employed, since the synthetic drug sometimes produces vaso dilatation if injected Ephedrine takes longer to act than adrenaline, and is therefore of less value in the treatment of an asthmatic attack The author points out that the drug acts mainly on the blood vessels of a mucous membrane, and does not, therefore, produce the sweating and paleness which is often seen with adrenaline Occasionally patients are seen who exhibit an idiosyncrasy to the drug, with headache and insomnia, but these symptoms vanish after the hypodermic administration of a small dose of atropine

107 Treatment by Fixation Abscess

A PIC and P DELORE (*Journ de Med de Lyon*, April 20th, 1930, p 263) discuss the value of fixation abscess in prognosis and in treatment They state that if repeated turpentine injections fail to produce an abscess, the prognosis may be regarded as fatal, abscess formation is not always followed by recovery, but the outlook is very hopeful When, after the failure of several injections, the last produces an abscess, the prognosis is improved In 122 cases of puerperal infection there was only one exception to the general rule, recovery ensuing in spite of a very feeble abscess reaction When a definite reaction is present, and the progress of the disease does not appear to be modified, tuberculous infection should be suspected, especially in cases of broncho pneumonia Doubt as regards the curative value of fixation abscess is attributed by the authors to the facts that some authorities have condemned it without trial the injections are often given too late in hopeless cases, and their repetition is unwisely neglected when the first has failed, faulty technique may cause severe pain or accidents, and a satisfactory scientific theory of this method is lacking at present, although its practical value is undoubted The technique is simple within the ability of any practitioner, safe, and often efficacious The average of successes recorded by many authors is 65 per cent Fixation abscess, though not a panacea, succeeds in many cases in which all other methods have failed, it represents a modification of the old methods of seton and cautery

108 Neosalvarsan in Necrotic Herpes Recurrens

P BALOG (*Derm Woch* , May 3rd, 1930, p 617) records the case of a man aged 45, the subject of herpes recurrens, who developed necrotic herpetic lesions of the nose and upper lip There was no history or evidence of syphilis, and the Wassermann, Sachs Georgi, and Meinicke reactions were negative Since all other treatment proved unsuccessful, three intravenous injections of neosalvarsan, in doses of 0 15, and 0 45 gram, at intervals of a few days between each 0 3, were given, in view of its favourable action in injection- ative skin conditions of a non syphilitic nature many ulcer- ing at once took place, and no recurrence had Rapid heal occurred when the patient was last seen ten months later

109 Malarial Therapy in General Paralysis

C HENRY (*Trans Austral Med Cong* , 1930, p 255) records his observations on 190 cases of general paralysis treated by the medical officers of the Department of Mental Hospitals of New South Wales with subcutaneous injections of malarial blood Improvement rarely began before a month after treatment The first sign of improvement was a rapid and permanent gain in weight Mental improvement was shown by (1) the moderating, and in some cases entire disappearance of grandiose delusions, (2) the decrease of depression, and (3) previously idle, untrustworthy, and violent patients

becoming industrious, docile and useful workers No relation was found between the type of the patient and the improvement rate No important complications ensued Herpes labialis occurred in 65 per cent , and diarrhoea in 72 per cent The anaemia was not extreme, and was easily remedied by arsenic and iron A very definite increase in the number and size of the blood platelets was the most striking feature of the blood film

Neurology and Psychology.

110 Etiology of the Spinal Symptoms in Anaemia.

M CRITCHLEY and J G GREENFIELD (*Brain*, April, 1930, p 11) point out that, in contradistinction to the cerebral manifestations of the severe disorders of the blood forming organs, symptoms of a paraplegic nature have received scant attention Although rarely mentioned these spinal forms are not actually uncommon Certain of the spinal changes in the leucoses may throw light on the causation of the commoner paraplegic manifestations of pernicious anaemia After briefly reviewing the literature on the subject, the authors describe the paraplegic manifestations of the leucoses under seven heads, six being briefly delineated, while the seventh is fully dealt with, 4 personal cases are recorded and 13 are cited from the literature Since leukaemia and chloroma are of essentially similar nature, no distinction has been made between the neurological syndromes complicating the two conditions The commonest cause of spinal symptoms in the leukaemias is an infiltration of the spinal meninges with leucocytic masses, though this is more frequent in chloroma The neoplastic cell masses usually lie between the inner aspect of the vertebrae and the spinal cord, they are more or less firmly adherent either to the vertebral periosteum or to the dura mater The epidural fat becomes infiltrated and is ultimately replaced by the massed leucocytic infiltration, which may lie anteriorly or posteriorly, or may encircle the cord, it is usually of some length and may extend from one end of the cord to the other Frequently the infiltration spreads and involves the anterior and posterior nerve-roots, which are rarely implicated alone sometimes it follows the course of the roots into the paraspinal fascia and muscles through the intervertebral foramina The secondary changes in the cord vary In some cases at the level of the largest masses the cord appears constricted and pale, and cross section shows an anaemic condition, the pia mater sharing in the ischaemic process In other cases the cord is obviously hyperaemic at the tumour site, and on cross section punctuate haemorrhages may be seen Both types are probably caused rather by obstruction of the blood vessels than by actual compression of the cord The pathological condition resembles that seen in subacute combined degeneration of the cord, differing from it in its patchy distribution and in the great swelling of the axis cylinders The early symptoms are some sensory complaint, usually pain, which is generally severe and of sudden onset Other sensory symptoms may occur Shortly after the onset the paraplegia develops in the lower limbs, and is usually accompanied by objective sensory changes and bladder disturbances Bed sores quickly appear and the patient rapidly loses weight and becomes febrile Visceral manifestations may be detected at this stage and reveal the true nature of the case The finding of immature white cells (myelocytes or myeloblasts) in the cerebro-spinal fluid is an important diagnostic point

111 The Visual Fields in Cerebral Tumour

W D SHELDEN and W I LILLIE (*Journ Amer Med Assoc*, March 8th 1930 p 677) discuss the localization of cerebral tumours, and illustrate this subject with copies of perimetric charts taken in cases described by them While admitting that exact perimetry is a matter for the expert they suggest that a rough comparison of a patient s fields with that of the practitioner may often give valuable information when the classical triad of headache, vomiting and optic neuritis is not completely present, and may, moreover, give assistance in the actual localization of a cerebral tumour Optical signs attributable to tumours in different regions are described as follows In tumours of the frontal lobe the syndrome of Gowers–Paton–Kennedy was optic atrophy with scotoma on the side of the lesion and choked disc in the other eye, but various combinations of signs are possible There may be unilateral scotoma with normal fundi unilateral central scotoma and pallor of the disc the opposite eye being normal, bilateral central scotoma with pallor of the discs bilateral central scotoma and choked discs unilateral amaurosis and optic atrophy with a choked disc on the other side unilateral amaurosis and optic atrophy, with a choked disc and central scotoma on the other side central scotoma, with alterations in visual fields due to secondary contractions from the choked disc, and bilateral amaurosis These signs may be further modified by extension of the tumour to the region of the chiasma, a case is described where bilateral scotoma was associated with olfactory symptoms, and a tumour of the olfactory groove was correctly diagnosed In tumours involving the chiasma the bilateral hemianopic defects are characteristic and an apparent dissociation of function for visual capacity for forms and colours may exist The tumour may arise from any of the structures near the chiasma, and affect the optic nerves the chiasma itself, and either or both optic tracts Distension of the third ventricle, secondary to tumours of the posterior fossa, is assumed, by its influence on the chiasma to be the cause of binasal hemianopia, such fields are uniformly associated with optic atrophy secondary to choked disc In the case of pituitary tumours, endocrine disturbances may give a clue to localization The optic tract may be involved in tumours arising from the walls of the third ventricle the characteristic sign is the rapid development of complete homonymous hemianopia to forms and colour The intimate relation of the tracts to the cerebral peduncles, the walls of the third ventricle, the ventricular system, the temporal lobes and the basal ganglia gives an opportunity for a multitude of associated symptoms and functional disturbances In tumours of the temporal and occipital lobes the greater separation of the fibres of the optic radiation permits of gradual and partial impairment of function According to Henschen the spatial relationship of the fibres remains constant, thus a homonymous quadrant hemianopia for form and colour may be a guide to the direction of approach of a tumour to the visual pathway, but it does not give the exact localization, which may be the temporal, parietal, or occipital regions

112. Treatment of Nervous Diseases by X Rays.

O MARBURG (*Wien klin Woch*, May 15th 1930, p 609) summarizes the results of *x* ray treatment of various pathological conditions of the central nervous system reported by others and observed by himself Normal adult nervous tissue appears to be unaffected by *x* rays, while infantile and embryonic nerve tissue is sensitive, though not so sensitive as that of animals The rays apparently act mainly by dilating the vessels and altering the permeability of their walls In several cases the escape of cerebro-spinal fluid from a fistula was controlled by exposures to *x* rays, though whether the effect was attributable to diminished secretion or to more effective absorption has not yet been decided Pressure symptoms in early hydrocephalus were also relieved Because of the difficulty of distinguishing intracranial tumours from minor degrees of hydrocephalus Marburg considers it possible that the improvement which has undoubtedly followed *x* ray treatment of some so-called tumours has really been due to an effect on the quantity of the cerebro-spinal fluid rather than on any tumour cells which may or may not have been present He has found, however, that valuable results are obtained when *x* rays are used as a supplement to surgery when the complete radical excision of sarcomas and other tumours of the central nervous system is impossible The only tumours which disappeared completely, as demonstrated by lipiodol, were lymphogranulomata in the spinal canal Marked improvement followed irradiation in cases of traumatic headache as well as other intractable headaches A number of cases of epilepsy were apparently cured for the patients remained free from attacks for some years after several courses of *x* rays extending over one year It is suggested that similar prolonged treatment should be applied to migraine since the short courses employed hitherto have produced little effect

Obstetrics and Gynaecology

113. Stillbirths due to Intracranial Injury

JOYCE PAPTRIDGE (*Journ Obstet and Gynaecol of the British Empire*, Spring, 1930, p 1) states that intra natal and neo-natal deaths of viable foetuses are caused in almost half the cases by intracranial injury Some reduction in this mortality may be secured by taking advantage of the mobility of the pubic and sacro-iliac joints. In the non pregnant woman according to post mortem findings the range of movement is negligible before puberty, it increases until about the age of 23 and gradually falls towards the menopause The author s investigation of an unspecified number of stillbirths occurring at the Royal Free Hospital during eight years indicated that the percentage of stillbirths is least in patients aged about 28 the graphs showing mobility at the pubic joint at various ages on the one hand, and on the other the percentages of stillbirths reveal an inverse relation As was shown by Budin and by Cantin almost all pregnant women acquire during the twenty weeks before term a mobility of the pubic (and therefore the sacro-iliac joint —hich is demonstrable

clinically by placing the finger in contact with the pubic joint, the patient standing first on one and then on the other leg From an ante natal examination of this sort in 100 patients the author concludes that where the pubic joint motility is free the second stage of labour (the foeto pelvic proportion being favourable) lasts as a rule less than an hour In this series four patients had almost immobile pubic joints, of these, two had stillbirths, one required forceps extraction for foetal distress although the foeto pelvic measurements were not disproportionate, and the fourth had Caesarean section In the vast majority of cases, in which movements of the sacro iliac and pubic diarthroses are present towards term, positional treatment logically deserves trial During the first stage of labour the upright position, while diminishing the antro posterior diameter of the inlet, stretches the sacro iliac and pubic ligaments, the complete Walcher position, while reducing tension in the ligaments, produces counter nutation of the sacrum, the promontory falling backward with maximal enlargement of the antro posterior diameter of the inlet In the second stage nutation of the sacrum with drawing up of the pubic bone, tilting of the promontory towards the brim, and retropulsion of the lower end of the sacrum and coccyx, serve to enlarge the outlet, nutation is promoted by flexion of the thighs, by pushing the feet against the end of a bed, and by pulling on a towel attached to the same place—three factors the utility of which is traditional Walcher's position, diminishing the pelvic outlet but increasing the inlet, is indicated during the first rather than the second stage The author thinks that publiotomy, although at present out of fashion in this country, might have better results in hospital practice She adds that conservative obstetric methods, towards which the pendulum has swung of late, are capable of being pursued to the social disadvantage of the race, in that they cause the children of the best cranial stock to run the greatest risks in delivery

114 Indications for Caesarean Section

H THROSBY (*Med Journ Australia*, April 12th, 1930, p 487) discusses the indications for and against Caesarean section in varying circumstances, citing statistics from several sources He concludes that most patients in whom septic infection is suspected should be treated by the lower segment operation, unless (1) the outlet is contracted with the head deeply in the pelvis or (2) the operator is unfamiliar with abdominal work, and skilled assistance is not available, in the second case the classical operation, with the technique of Frances Ivens, should be adopted Tropacocaine spinal anaesthesia should be seriously considered as advisable in patients who have advanced cardiac or renal disease, in cases of ante partum haemorrhage, and when inhalation narcosis is contraindicated Throsby believes also that spinal anaesthesia is preferable in certain other types of patient when Caesarean section is indicated, great advantages being the better coaptation of the uterine wall and the lessened haemorrhage He is not, however, prepared to recommend it yet as a routine procedure The suture material for the uterine wall should be capable of being absorbed, plain gut is preferable when there is undoubted septic infection, but otherwise the sutures may well be of both chromicized and plain gut

115 Puerperal Infection due to B typhosus

ACCORDING to E SCHNIRER (*These de Paris*, 1930, No 17), who records seven illustrative cases, Kuhnau in 1896 was the first to incriminate *B typhosus* as one of the organisms capable of causing septic trouble in the puerperium Two years later Dobbin isolated the organism from the lochia of a woman suffering from a puerperal infection, similar observations were made by Blumenthal in 1902 and Bezançon and Philibert in 1904 Puerperal septicaemia due to this cause must be distinguished from typical enteric fever occurring in the puerperium, and from cases of septicaemia due to *B typhosus* developing in pregnancy and continuing into the puerperium with anatomical lesions closely resembling those met with after delivery at full term or abortion The author attributes the rarity of puerperal infection due to *B typhosus* to the multiplicity of factors needed to produce it—namely, a typhoid carrier, an intestine which has a local immunity, and a genital infection at the time of delivery

116 Treatment of Cervical Cancer by Abdominal Hysterectomy

BERGOUIN (*Bordeaux Chirurgical*, April 1930, p 1) has endeavoured to estimate the proportion of cured cases of cervical cancer which are found to be free from morbid symptoms ten years after their treatment by abdominal hysterectomy As the results of his own experience of Wertheim's operation, and the study of the available statistical evidence, he comes to the conclusion that 40 to 45 per cent of those so treated show no further signs of malignancy ten years subsequently, and he believes that, when such a period of time has elapsed without the development of suspicious manifestations, recovery may be considered absolute, since recurrence is a very rare exception He considers, indeed, that a five year period of observation is adequate in most cases, and he deprecates the pessimism of those who emphasize the incurability of cancer, attributing, in his opinion, too much importance to the very occasional recurrences five years after operation

Pathology.

117 Determination of Blood Groups with Dried Serum

M LISLER and N KOVÁCS (*Münch med Woch*, April 25th, 1930, p 709) employ the following procedure for estimating blood groups Glass tubes of 5 mm inner diameter are filled from a graduated pipette with a certain amount of test serum, which is dried in the usual manner and then sealed, two sets of five tubes are prepared, five of colourless glass for A serum, and five of blue streaked glass for B serum With another pipette 0 02 c cm of blood is sucked up and then blown into an ampulla containing 1 c cm of physiological saline solution, the pipette being washed out several times in the salt solution, in this way is obtained a 2 per cent suspension of the blood to be examined, a set of five such ampullae are prepared By using such a blood dilution pseudo agglutination or interference by anti isoagglutinins is obviated The blood suspension is now pipetted up to 0 02 c cm and blown into one of the tubes containing A serum, and also into one of the tubes containing B serum, which has been previously filled and opened, the tubes are then shaken for about a minute If agglutination occurs in one or both tubes it commences as fine clumps, which soon increase in size and fall to the bottom of the tube, and in about five minutes the supernatant fluid is colourless If agglutination has not occurred the contents of the tube remain homogeneous

118 The Alkaline Reserve in Malignant Growth and Hepatic Disease

G PACETTO (*Il Policlinico*, Sez Chir, April 15th, 1930, p 167) comes to the following conclusions as the result of the study of 26 cases of malignant disease of various organs and 19 cases of hepatic disease, including cholelithiasis, atrophic cirrhosis, and hydatid cysts Subjects of malignant growths do not show any considerable changes in the acid base equilibrium which have any constant or appreciable effect on the alkaline reserve in the blood In a high proportion of cases (80 7 per cent) the alkaline reserve is normal, and it is only in rare cases that its value is subnormal In view of the rarity of such cases it is doubtful if the low values are due to the growth itself, it is not improbable that the influence of the growth is indirect, and that other factors are concerned After operation there may be no alteration in the alkaline reserve, but usually there is a slight change in the way of decrease or increase While, however, the former is only temporary the latter persists for some time after the operation In the subjects of hepatic disease there is a close connexion between the morbid condition and the alkaline reserve, a fact which illustrates the importance of the hepatic function in the maintenance of the acid base equilibrium In a considerable proportion of cases (47 3 per cent) Pacetto found an alkaline reserve of low value before the operation, but on recovery a large number showed an increase of the alkaline reserve, which lasted for some time after the operation

119 Influence of Acid-forming and Base forming Diets

EMMA L SAMUEL and I N KUGELMASS (*Amer Journ Dis Child*, April, 1930, p 687) experimented on two groups of rats with an acid forming diet composed mainly of eggs, rice, and oatmeal, and a base forming diet chiefly of potatoes and lima beans They consider that certain inferences significant in infant feeding are warranted Dilution of cow's milk with water or carbohydrates causes a disproportionate diminution in the intake of basic mineral matter, but the modern trend to concentrate feeding eliminates such a possibility, and the early employment of orange juice and cod liver oil favours the retention of basic elements After weaning there may be a mineral deficiency from the introduction of refined cereals, this may be corrected by supplementing the diet by fruit and vegetable juices or purées A base forming diet is antirachitic, since it favours the retention of calcium and phosphorus During the acute infections and gastro intestinal disturbances the addition of base forming foods is corrective of the acidosis The authors conclude that throughout the period of growth there should be included in the daily dietary adequate amounts of base forming foods—namely, milk, fruit, and vegetables

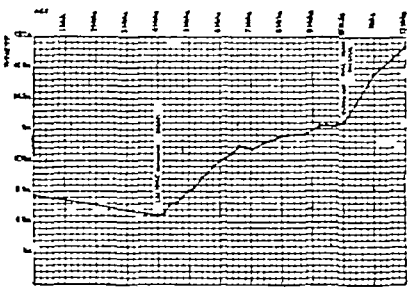
A "RESURRECTION"

GUILDFORD
30 6/30



"Baby Hook, came under my care shortly after birth suffering with marasmus following whooping cough Broncho-pneumonia developed and was with great difficulty cleared up, leaving the child in a very low condition. Feeding proved a difficult problem, several things were tried without beneficial results The results with Cow & Gate were truly wonderful, indeed it is a case of 'a resurrection.'"

(Signed)..... M.B Ch B

Lacidac (separated) and Brestol, the Cow & Gate Humanised Cream, were used in the early days of treatment. Cow & Gate Full Cream and Brestol being used subsequently.

BEFORE—4 months' old, 6 lbs. 9 ozs. in weight.

Progress Chart

AFTER—10 months old, 12 lbs. 6 ozs. in weight.

June 1930 Baby Hook has now won a prize in a Baby Competition!

Write for literature and clinical samples of Lacidac and Brestol.

FOR DEAFNESS

Doctors prefer "ARDENTE" because—

"ARDENTE" STETHOSCOPE

Mr L H Dent makes a Stethoscope specially for members of the medical profession suffering from deafness Many are in use, and excellent results are reported on the latest as evidenced by the interest shown at Last B M A Meeting

1 It is individually fitted to suit the case for young middle aged or old
2 It is simple and true to-tone and leaves the hands free
3 It removes strain thus relieving head noises giving inconspicuous hearing
4 It conveys sounds from varying ranges and angles
5 It is entirely different uncopyable and carries a guarantee and service system
6. It is suitable for "hard of hearing" or acutely deaf through various causes
7 It is helpful for conversation music talkies wireless, home office, public work, and sports

FREE HOME TESTS
arranged for Doctors and Patients
Medical Prescriptions made up to the minutest detail

NORTHAMPTON.

FOR THE UPPER AND MIDDLE CLASSES ONLY

President THE MOST HON THE MARQUESS OF LAFTER, C.M.G., A.D.C.

Medical Superintendent DANIEL F. RAMBAUT, M.A., M.D.

This registered Hospital is situated in 120 acres of park and pleasure grounds. Voluntary Boarders—persons suffering from incipient nervous and mental disorders, as well as certified patients of both sexes are received for treatment. Careful clinical biochemical bacteriological, and pathological examinations. Private rooms with special nurses, male or female, in the Hospital or in one of the numerous villas in the grounds of the various branches can be provided.

WANTAGE HOUSE

This is a Reception Hospital in detached grounds with a separate entrance to which patients and voluntary boarders can be admitted. It is equipped with all the apparatus for the most modern treatment of Mental and Nervous Disorders. It contains special departments for hydrotherapy by various methods including Turkish and Russian baths, the prolonged immersion bath, Vichy Douche, Scotch Douche, Electrical bath, Plombières treatment, etc. There is an Operating Theatre, a Dental Surgery, an X-ray Room, an Ultra-violet Apparatus, and a Department for Diathermy and High Frequency treatment. It also contains Laboratories for biochemical, bacteriological, and pathological research.

MOULTON PARK

Two miles from the Main Hospital there are several branch establishments and villas situated in a park and farm of 650 acres. Milk, meat, fruit, and vegetables are supplied to the Hospital from the farm, gardens, and orchards of Moulton Park. Occupation therapy is a feature of this branch, and patients are given every facility for occupying themselves in farming, gardening, and fruit-growing.

BRYN-Y-NEUADD HALL.

The seaside house of St. Andrew's Hospital is beautifully situated in a Park of 330 acres at Llanfairfechan, amidst the finest scenery in North Wales. On the North-West side of the Estate a mile of sea coast forms the boundary. Voluntary Boarders or Patients may visit this branch for a short seaside change or for longer periods. The Hospital has its own private bathing house on the seashore. There is trout fishing in the park.

At all the branches of the Hospital there are cricket grounds, football and hockey grounds, lawn tennis courts (grass and hard courts), croquet grounds, golf courses, and bowling greens. Ladies and gentlemen have their own gardens, and facilities are provided for handicrafts such as carpentry, etc.

For terms and further particulars apply to the Medical Superintendent (Telephone No. 56, Northampton), who can be seen in London by appointment.

HIPPOCRATES
(*c.* 370 B.C.)

In therapeutics the "Father of Medicine" believed in assisting nature although he knew the use of many drugs. Fresh air, good diet, barley water, wine, massage, hydrotherapy and purgation were the plain expedients which he advocated.

BLACK HELLEBORE the universal purge in the days of Hippocrates, has probably helped many to return to health, who would have been little benefited by bleeding and other heroic contemporary measures of treatment.

A clean intestinal tract is of no less importance to-day in maintaining and restoring health than in ancient times. But the therapeutic measures have changed. Modern research has made available

AGAROL

BRAND COMPOUND

the original mineral oil emulsion with phenolphthalein. The bitter taste of hellebore has been replaced by the agreeable taste of Agarol Brand Compound, in place of the danger of irritation of mucous membranes Agarol Brand Compound offers safety from accessory effects. It *gently stimulates* the peristaltic function, and by softening the intestinal contents makes evacuation easy and painless. Used over an adequate period, it tends to re-establish normal function.

Liberal trial quantities at the disposal of physicians upon request.

THE RATIONALE OF THE ACTION OF RYVITA CRISPBREAD IN CERTAIN SPECIAL CONDITIONS

INDIGESTION

The great ease of digestion of Ryvita is due both to its physical and to its chemical nature. Its crispness and dryness necessitate proper mastication and ensure thorough insalivation. Thus not only is the Ryvita itself extremely easily digested, but other foods eaten at the same time are also rendered much easier of digestion.

The high percentage of soluble carbohydrate greatly lightens the burden of starch digestion.

Ryvita has alleviated the condition of many who have suffered a lifetime of chronic dyspepsia.

Ryvita is made of pure, crushed wholegrain rye. It is balanced by its own B Vitamin, since the structure of rye grain prevents the germ being lost in the milling, as it so often is from wheat or oats. Ryvita is rich in the natural organic salts of iron, phosphorus, and lime.

Ryvita is definitely indicated as an item of the dietary in treatment of disorders arising from digestion, constipation, or malnutrition. It is usual to suggest that the patient begin by eating two or three slices of Ryvita with at least one meal each day.

RYVITA

CRISPBREAD

We shall be very pleased to send Free Samples and full particulars to any interested Member of the Profession

A Surgical Support Can Be Effective and Yet Be Light in Weight, Comfortable and Beautiful

PHYSICIANS and surgeons themselves, to say nothing of their women patients demand surgical supports these days which are not only effective but are also light in weight and comfortable in cut and fit

Twenty years ago surgical supports were heavy Changes in women's habits of life have led gradually to a demand for greater comfort and freedom in surgical supports as well as in "style" corsets Physicians and Spencer designers co-operating in numerous experiments know now that a surgical support can be effective and yet be light in weight and pleasant to wear

SPENCER SUPPORTI G CORSET

Front opened and held back to she r inner supporting section.

Because the Spencer support is individually designed for the patient who is to wear it it will stay in position on the figure, and do the work required of it even though it is so comfortable that the wearer is hardly aware of its presence

Physicians expe nce but little difficulty a getting co-ope on of patient to m Spence up port an pre bed because the g rment can be made beautiful and serve all fashion requirements and yet do the work that the physician demands of them

By making an appointment with a Spencer Corsetiere you can see and have demonstrated to you all kinds of Spencer upport —those for maternity and p st partum for hernia, enteropto s ptosis kidney and sacro-iliac stra

In your o n to n at any time you can have the co-operation of a Spencer Corsetiere who is trained to take measurements accurately to describe posture and figure exactly to adjust garments properly to give intelligent after-service under the physician s instructions We will gladly send you any or all of the booklets on the uses of Spencer supports

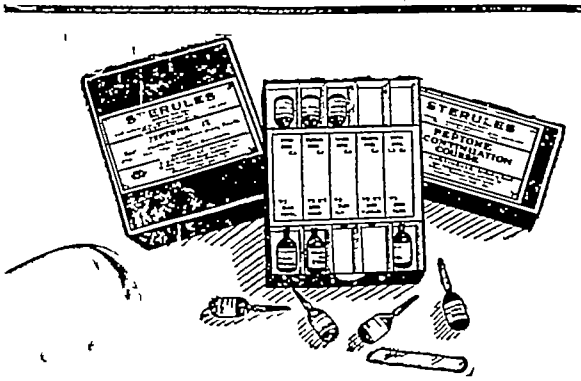
Dermatoses

Physicians will find in Emol-Keleet an effective adjuvant in the treatment of pruriginous and eruptive dermatoses Emol-Keleet is most comforting to the patient, since its sedative action affords immediate relief from the distressing itching



As a protective dressing in the treatment of Eczema, and for allaying the prurigo accompanying Scarlet Fever and Measles, it can always be relied upon to bring immediate relief

In infantile cases especially, the value of Emol-Keleet in clearing up rashes is most marked

Samples free to the Medical Profession on request

SELECTIVE GERMICIDAL POWER

STREPTOCOCCUS HAEMOLYTICUS

It is not generally recognized that antiseptics exhibit wide variations in their power of killing different bacteria Phenol, the first antiseptic ever used, affords an example of this It differentiates so markedly between the typhoid-coli group and the Gram-positive cocci that if added in the proportion of 1 in 200 to a medium inoculated with a mixture of B coli and streptococci, the former are killed and the latter multiply

Monsol, which is derived from a by-product of the Mond power-gas process, differs radically from other coal-tar antiseptics in its selective action which is the opposite of ordinary coal-tar preparations Its power of killing the STREPTOCOCCUS PYOGENES, and notably the strain HAEMOLYTICUS, is more than 10 times greater than that of pure phenol or of lysol

Monsol is non-irritant, and can be applied in effective dilution even to mucous membranes In view of these facts it is not surprising that Monsol has been found to have unprecedented qualities in the treatment of Streptococcal infections

Monsol can be applied to the treatment of septic conditions of the SKIN the MOUTH and THROAT and the MUCOSA, and is especially indicated in Obstetrics

Bowel Inertia

THE Physician is familiar with the patient who complains of headache loss of appetite depression who is not suffering pain but is nevertheless conscious that his or her general health is far below the standard it should be

Diagnosis often reveals auto-intoxication—the result of habitual constipation The use of a suitable eliminant is indicated

Cristolax proves exceptionally successful in such cases It is composed of 50% of the purest medicinal paraffin in combination with 50% Wander Dry Malt Extract The high diastasic quality of the pure malt extract gives material assistance to the digestive process which is often impaired in this condition whilst the oil content lubricates the intestinal tract keeps the *fæces soft* and ensures their complete expulsion

A delicious preparation in a clean convenient dry form for infants children and adults

Cremo-Carbonates

(Tri-Carb-Cream-Mulford)

CREMO-CARBONATES presents certain unique features which warrant its preference whenever an antacid and corrective is indicated For the first time the well-known protectives and antacids—bismuth, magnesia, and lime—are supplied as a suspension of particles of colloidal dimensions

Its colloidal nature gives it maximum covering power superior to that of a mere mechanical mixture of bismuth, magnesium, and calcium

CREMO-CARBONATES is a soothing antacid, corrective, and digestant, particularly useful in the treatment of hyperacidity accompanied by flatulence and of any other conditions where there is excessive secretion of the gastric juices

Effective—Non-Caustic—Palatable

Literature and samples sent free to members of the medical profession

Specially indicated in
NEPHRITIS - URÆMIA - ECLAMPSIA - ALBUMINURIA
and allied conditions.

PROMPT and proper diagnosis of kidney conditions is necessary in cases of Bright's disease and all types of renal disorders In nine cases out of ten the administration of a specific capable of producing real results in compensating for the loss of kidney function is also necessary

For more than a quarter of a century Nephritin has been a sheet anchor to physicians in treating such disorders Nephritin Tablets induce a marked increase in nitrogenous waste elimination They reactivate the cells of the kidney, increase urinary secretion, and induce a greater output of urea

Given in sufficient dosage these tablets produce marked results, and restoration to normal is quickly stimulated They are invaluable also as a prophylactic in renal complications of infectious diseases and during pregnancy The tablets are composed of the hormones of the normal kidney as they appear in nature—*absolutely unaltered*

Samples and Descriptive Literature from Sole Distributing Agents for U K and Irish Free State COATES & COOPER, 41, Great Tower Street, London, E C.3

MARSHALL'S *Lysol*

LYSOL LTD RAYNES PARK LONDON S W 20

Builds up in underweight conditions and provides a perfectly balanced, highly nutritive diet for growing children

TO the problem of the "underweight" child Horlick's Malted Milk provides a convenient solution

For many years it has been successfully used by the medical and nursing professions for fast-growing children, for invalids, for expectant and nursing mothers — in all cases where it is particularly important to sustain strength and replenish natural energy quickly

Excellent results obtained by adding Horlick's to the diet of growing children have been strikingly recorded in many thousands of letters written by parents and members of the medical profession

Made from fresh, full-cream cows milk, selected wheat and malted barley, Horlick's Malted Milk constitutes a perfectly balanced food — containing fat, proteids, and soluble carbohydrates in correct nutritive ratio.

The vitamins of its constituents are unimpaired by the Horlick process

Horlick's contains neither cane sugar nor unaltered starch, but presents in proper proportions a sufficiency of valuable malt sugars, for which children have a greater toleration. Moreover, Horlick's is partially pre-digested during manufacture, thereby assuring perfect assimilation

In addition to its important body-building qualities, Horlick's has the advantage of being an extremely palatable beverage Most children like the natural flavour of malt and will drink Horlick's with pleasure And it is now obtainable also in a new Chocolate Flavoured form — identical in constituents with the original Horlick's, but with fine chocolate added

Horlick's Malted Milk (both forms) is obtainable everywhere in sealed glass bottles, at 2 -, 3/6, 8/6 and 15/- Also in tablets

Further details and supplies for tests may be obtained from Horlick's Malted Milk Co , Ltd., Slough, Bucks

Irritable Bowel

Nujol is of great assistance in the treatment of chronic irritable bowel Unlike cathartics, whose action is stimulating to the muscles or irritating to the lining of the intestines causing excessive secretion of mucus, Nujol acts merely as a gentle lubricant and solvent of impacted fecal matter Though it absorbs intestinal toxins to a high degree, it cannot, itself, be absorbed Consequently, toxemia is prevented, peristalsis is at a natural rate, and the stool is normal and properly formed

Nujol

REGISTERED TRADE MARK.

'ZYMINE' Peptonising Tubes

(FAIRCHILD)

For the preparation of Peptonised Milk and other Predigested Food for the Sick.

'Zymine' Peptonising Tubes have been in use since 1882, making it possible for physicians to assure proper nutrition to their patients, even in cases where digestive power has been reduced to its lowest terms, and enabling chronic dyspeptics, invalids, convalescents, etc., who must live upon fluid foods for more or less prolonged periods, to take milk in quantities sufficient to maintain nutrition and promote restoration

PEPTONISED MILK presents all the nourishment of plain milk freed from the objectionable qualities which constitute so serious a drawback to the utilisation of milk in the feeding of the sick. And of the many methods employed to make milk an available food for the sick, there is none that approaches the 'Fairchild' peptonising process in the certainty with which it accomplishes the desired purpose

Supplied in boxes containing 6 and 12 Tubes.

The contents of one Tube will peptonise one pint of milk

Originated and Manufactured by
Fairchild Bros. & Foster (Inc. N.Y.)

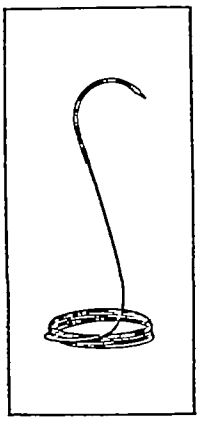
MALNUTRITION and MARASMUS

Mellin's Food when given in conjunction with cow's milk and water produces an immediate gain in weight in fermentative dyspepsia and in wasting disorders of early infancy. For the prematurely born infant Mellin's Food proves invaluable

As is well known, sugars exhibit varying tendencies to fermentation in the digestive organs. Milk sugar ferments most rapidly, less rapidly cane sugar, and maltose still more slowly, and the high percentage of dextro-maltose in Mellin's Food accounts for its usefulness in all such cases of malnutrition



Mellin's Food

The booklet "Modified Milk in Infant Feeding" deals fully with the use of Mellin's Food in cases of malnutrition, and will be gladly sent together with samples to Members of the Medical Profession

MELLIN'S FOOD LTD., LONDON, S.E.15.

A GALACTAGOGUE AS WELL AS AN INFANT FOOD

Almata does not claim to be a mammary "stimulant" Its marked success as a galactagogue is due to the balance of its *natural* food constituents, its easy digestibility, and the presence of all the vitamins

Its value in this respect has been amply proved by clinical observation Medical Practitioners who have prescribed Almata for expectant mothers have reported that a generous flow of breast milk has in due course resulted Others have found that in cases where the milk supply has been scanty, Almata taken by the mother has resulted in improved quantity and quality of the milk

Almata is a blend of natural foods—butter, egg yolk, malto-dextrins, milk protein, fruit juice, etc —which contain all the vitamins Furthermore, the balance of its constituents closely resembles that of normal breast milk In addition to its suitability as a food for infants from birth Almata has been found highly efficient when prescribed as a galactagogue

ALMATA

KEEN'S COMPLETE FOOD

A LIBERAL SAMPLE, sufficient for a clinical test, will gladly be sent to Members of the Profession on request Sold by all Chemists Price 4/- per tin, small size, 2/1

Manufactured by KEEN, ROBINSON & CO, LTD, Carrow Works, Norwich
(Incorporated with J & J Colman Ltd)

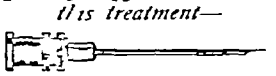
The Injection Treatment of Varicose Veins

TRADE MARK 'HYPOLOID BRAND

QUININE AND URETHANE

Quinine Bihydrochloride, 0 26 gm , and Urethane, 0 13 gm , in 2 c c

2/- per box of 5 containers *Rubber-capped bottles of 25 c c , 3/- per bottle*



TRADE MARK 'HYPOLOID' BRAND

SODIUM SALICYLATE

20, 30 and 40 per cent solutions in 5 c c phials, boxes of 5 containers, 2/9 per box

These products provide sterile sclerosing solutions in convenient strengths and quantities, ready for immediate use

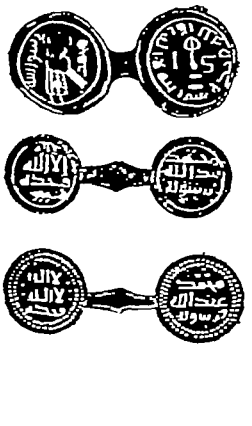
Specially supplied for use in this treatment—

No 21S Rustless Steel Needles, 10d each

To use these Needles with a 5 c c or 10 c c. 'AGLA' Syringe an 'AGLA' Nozzle Adapter is required—price 6d each

TRADE MARK 'AGLA' BRAND SYRINGES

For use with 'HYPOLOID' Quinine and Urethane
2 c c , price 11/ each



For use with 'HYPOLOID' Sodium Salicylate
5 c c , price 15 each
10 c c , price 20/6 each

Prices in London to the Medical Profession *Special literature free on request*

CALIPHS WHO LAID THE FOUNDATIONS OF THE GREAT ARABIAN EMPIRE.—An expedition against the Romans for the possession of Syria, planned by Mahomet, and carried out by his successor the first Caliph, Abu Bekr was unsuccessful. The Arabs put themselves in training under their vanquishers and before long at a siege of Damascus their opponents were stupefied to see them equipped with war machines which equalled the best Graeco-Roman types and were as well manipulated. Abu Bekr was gentle wise and strong a fine organiser he welded the people together and strengthened their purpose Under Omar the second Caliph most of the conquests begun were actually accomplished he gave the new power a navy His character and enlightened policy are illustrated by one of the most impressive sayings in history "By Allah, he that is weakest among you shall be in my sight the strongest until I have vindicated for him his rights but him that is strongest will I treat as the weakest until he complies with the laws" Coins of these Caliphs are here reproduced.

BELLE VUE SPA

TREFRIW, NORTH WALES.

(Railway Station Llanrwst and Trefriw)

COMBINED TREATMENT OF ARTHRITIS

By Chalybeate Waters, Tonic Baths and Extension Appliances.

The Belle Vue Spa Hotel provides accommodation for patients for whom these tonic chalybeate waters are indicated External treatment by tonic baths, as well as by manipulation and extension and light, is also provided

Recent analyses of the Belle Vue Spa waters show that they are exceptionally rich in ferrous salts Samples have been repeatedly examined by the Clinical Research Association

A new building furnished with Baths and all modern Electrical Appliances for treatment was opened on Saturday, April 26th

Under expert advice the drinking service of the Belle Vue Spa water is now taken from selected sources in the water-yielding rock, and served fresh at the Spa at a standard strength of 1 grain of ferrous sulphate in one ounce

For patients who are unable to visit Trefriw and take the water on the spot, it is bottled and exported at the same standard-strength for medical use in their own homes

In suitable cases of arthritis and rheumatic disease Hoefftcke's manipulative and ambulatory extension treatment can be applied

Mobility and freedom from pain in crippling arthritis of the hip and knee can often be obtained, even after shortening and contraction have occurred This is effected by the extension appliances, which maintain continuous extension by day and by night The appliance usually permits the patient to walk, and not only supports the weight but replaces the undesirable state of compression of the leg by one of active stretching

This method secures —

(1) Extension without muscle loss inevitable whilst the patient is kept in bed
(2) Extension without vascular stasis, which occurs when a joint is kept at rest
(3) MOVEMENT WITHOUT PAIN

The result has been a restoration of joint function in many cases which had been regarded as hopeless and incurable The Spa is under medical supervision and close co-operation is maintained with the patient's own physician

Further particulars may be obtained at Belle Vue Spa or 7, Harley Street W 1

ON

RECENT ADVANCES IN THE PHYSIOLOGY OF MENSTRUATION

BY

D J CANNON, M B, B Ch, M A O

EXTERN EXAMINER IN THE NATIONAL UNIVERSITY OF IRELAND VISITING SURGEON TO THE CHILDREN'S HOSPITAL, DUBLIN

In many countries particularly France and America, there is grave danger of gynaecology becoming merged in general surgery. Emil Novak, who is fighting a magnificent battle for the autonomy of gynaecology, says, that so long as gynaecology is regarded as embracing also a knowledge of the special anatomy, physiology, and pathology of the female reproductive organs, it will constitute an effective breakwater against the invasion of general surgery. No gynaecologist to-day can consider himself thoroughly equipped unless he is well grounded in these fundamentals. This is particularly true of the physiological aspect, which to-day represents the growing edge of our specialty. It is for this reason that I have chosen as my theme a consideration of the many problems connected with the human menstrual cycle.

Ever since Knaeur, by his transplantation experiments in 1899, showed that the ovarian influence responsible for menstruation is exerted through the blood stream and not through the nervous system, the problem of menstruation has been the subject of extensive investigation. Within the past ten or twelve years the amount of experimental work that has been done on the internal secretion of the ovaries has been stupendous, and, although the results arrived at by different observers have been at times conflicting, none the less, in spite of disagreements here and there a number of most interesting conclusions have been arrived at in accordance with the strictest rules of inductive logic. In order that we may appreciate the problems connected with menstruation let me epitomize Novak's classical description of the sequence of events in the menstrual cycle.

The discharge of the ovum from the follicle occurs in the intermenstrual period, most probably about the fourteenth day of the cycle. To be sure, it may occur earlier or later than this date. As the ovum passes down to the uterus, the mucous membrane of the latter prepares for its reception. This preparation begins immediately after the preceding menstruation, for there is a gradual hypertrophic change from this time up to the beginning of the next period. At first this is very gradual, so that at the time the ovum is discharged from the ovary the endometrium is only slightly thicker and its glands are only moderately tortuous, with no sign as yet of secretory activity or decidual change. This phase of the menstrual cycle is called the interval or follicular phase. After the rupture of the Graafian follicle, the gland epithelium begins to show signs of secretory activity, though these are not pronounced until, perhaps, five or six days before the next period. This is the pre-menstrual phase. At the peak of the pre-menstrual phase decidua-like cells appear, which divide the endometrium into the superficial compact and the deep spongy layers.

These facts in regard to the menstrual process are well established. When, however, we come to spell out the proper significance of the facts described we are faced with one of the most fascinating yet difficult problems in physiology.

When I speak of the number of interesting findings that have been arrived at in regard to the internal secretions of the ovary I want to make it clear that with the notable exception of the brilliant piece of histological work carried out by Novak and Wilfred Shaw on the human subject, these findings are largely the fruit of animal experimentation. Now unless the menstrual cycle resembles in its essentials the sexual cycle in the lower animals, we must be very cautious in transferring the results of animal experimentation to the interpretation of human phenomena.

What are the essential features of the sexual cycle in the lower animals?

During anoestrum, or the period of sexual tranquillity, the uterus is inactive, its glands are small and contracted and the mucous membrane is anaemic. The ovaries also are inactive. With the advent of pro-oestrus or "coming on heat," there is a ripening of the follicles in the ovary. Coincidently with follicular activity, there is a gradual development of the endometrium. The glands also show evidence of secretory activity, and the mucous membrane is hyperaemic and succulent.

Pro-oestrus is followed by oestrus during which as a rule, ovulation takes place (in some species only after copulation) accompanied by further changes usually of a retrogressive character in the accessory organs. It is at this period only, in the lower animals, that the female will receive the male. Should fertilization not take place the period of oestrus is immediately followed by pseudo-pregnancy. The essential feature of this stage is the presence of a menstrual decidua which is a miniature representation of the decidua of true pregnancy.

To Allen and Doisy of America we are indebted for the experimental proof that a hormone from the fluid of the growing Graafian follicle is responsible for the oestrous cycle in the lower animals. This hormone is called oestrin, or the oestrus-producing hormone.

To Corner, Allen, Parkes[1] and others we are indebted for the experimental proof that a special hormone manufactured by the luteal tissue of the corpus luteum is responsible for pseudo-pregnancy. Oestrin, or the oestrus-producing hormone even though it may produce actual bleedings in castrated monkeys, is unable however to produce the pregravid endometrium. As relevant to the problem of human menstruation let me indicate a few interesting variations in the sexual cycle of the lower animals.

In a bitch at the height of pro-oestrus haemorrhage appears externally. At the end of pseudo-pregnancy in the same animal haemorrhage occurs into the endometrium of the uterus, but does not appear externally. From the point of view of the oestrous cycle animals fall into two well-defined groups:

(*a*) The species in which the sexual season is associated with but one complete oestrous cycle—the monoestrous type.

(*b*) The species in which there is a recurrence of short oestrous cycles throughout the sexual season—the polyoestrous type.

In the lower animals, therefore, there are two distinct cycles, which come quite close to each other—the sexual or oestrous cycle and the reproductive cycle or the phase of pseudo pregnancy. When we study the human menstrual cycle in the light of the sexual cycle in the lower animals we are at once struck by the fact that among the higher animals, like man and the monkey, the sexual cycle seems to have disappeared altogether, or if there are vestige of it left they are difficult to decipher. It is this consideration that has led many clinicians to the view that the human menstrual cycle has only one phase—the reproductive phase or the phase of pseudo-pregnancy—and that the oestrous phase or cycle is completely merged out in the sequence of events that take place between one menstrual period and another. The pre-menstrual phase of the human menstrual cycle is according to this view designed to facilitate the implantation of the embryo and thus corresponds to the luteal or pseudo-pregnant phase of lower mammal. Menstruation therefore represents the abortion of an unwanted decidua.

There is a good deal of evidence in support of this view so admirably put by Professor P. W. Johnstone in a paper published this year. The pre-menstrual phase, like the pseudo-pregnant phase in the lower animal, begins after ovulation and the breakdown of the endometrium or menstruation, coincides with degenerative changes in the corpora lutea. Degeneration of pseudo-pregnant congestion sometimes accompanied by bleeding has been described in the rabbit by Hammond,[2] in the dog by Gerlinger,[3] and in the sow by Corner. X-ray sterilization

Read before the South Eastern of Ireland Branch on June 13th 1930.

I am glad to see that Emil Novak[11] in a recent paper agrees with my view of the periodicity of the human menstrual cycle These are his words

"In reference to Wagner's views on the primacy of the corpus luteum, provocative as Wagner's study is, it makes one wonder whether we are not chasing a will o'-the wisp, for beyond the corpus luteum looms the pituitary, and perhaps beyond the latter we shall have to fall back on some innate periodic human factor as elusive as the life principle itself"

SUBACUTE COMBINED DEGENERATION OF THE CORD IN PRIMARY ANAEMIA OF THE FOWL

ITS PATHOGENESIS AND THAT OF ASSOCIATED LESIONS

BY

J P McGOWAN, M A, M D
(From the Rowett Research Institute, Aberdeen)

(*With Special Plate*)

IN a previous communication[1] subacute combined degeneration of the cord was described as occurring in fowls with primary or pernicious anaemia This subject is of such importance to an understanding of pernicious anaemia and its nervous complications in the human being that the condition has been taken up again for more detailed discussion in the present paper

During the past four years seven such cases have been recognized and observed in some detail Their essential nature was first suspected when, post mortem, the milk-chocolate-coloured liver, small in size, was found present This, *indicative of the presence of haemosiderosis, is one* of the most characteristic findings in primary anaemia of the fowl A description of the cases in question will now be given

CASE I

Hen 104 White Leghorn, 1 year old, has been ill for some time, lying about on its side When approached it tries to escape, but staggers and at once tumbles on to its side again, mentally it is quite alert It died before any extended examination of its blood was made The haemoglobin, however, was 60 per cent, while a blood film showed a fair degree of erythroblastosis

Post mortem it was found to be very emaciated Naked eye, no obvious lesion was seen except that the liver, spleen, and kidney were exceptionally small in size, and that the liver showed the milk-chocolate hue The femur and tibia were filled with an abnormal marrow, which resembled blood in its colour and consistence, while the metatarsal bone was exceptional in that the fat there, instead of being pure yellow in colour, was of a reddish tint

Microscopic examination disclosed a marked haemosiderosis in the liver, spleen, and kidney, in the latter, especially of the secreting tubules The occurrence in this latter situation is to be emphasized because, in my experience, this has been found associated only with haemolytic conditions, and has not been observed to occur otherwise, as, for instance, in feeding experiments with large doses of iron salts Its occurrence, together with the appearances in the liver and spleen, in cases like the present one is regarded as strong evidence of a primary anaemic condition, existing behind the more obvious nervous implication

The marrow showed the appearances one finds in a primary anaemia—namely a haemocytoblastic hyperplasia and entire absence of fat cells The lower dorsal region and the lumbar enlargement of the spinal cord were treated by Marchi's method Sections prepared from these situations showed in both, but especially in the dorsal region degeneration of the white matter in the posterior and antero-lateral columns of the cord There was no neuroglial proliferation or sclerosis

CASE II

Hen 105 White Leghorn, 1 year old, has been lying about for some time quite alert, but shows a weakness of the right leg Haemoglobin is 70 per cent (normal for fowl), blood films show slight changes only, of the nature of anisocytosis, no erythroblasts seen

The conditions found post mortem, and microscopically in the liver, spleen, and kidney, especially as regards haemosiderosis, and in the marrow, were as in hen 104 The cord in the dorsal and lumbar regions showed similar degenerative changes

CASE III

Hen 107 Light Sussex, 3 years old paralysed in both legs and unable to stand *Haemoglobin is 70 per cent, red blood cells* 2,000,000 per c mm, while the blood films show nothing distinctively abnormal

Post mortem, the conditions present were much as in the previous cases This hen, however, was very fat The femur and tibia were greatly sclerosed and thickened, resulting in a great diminution in the quantity of marrow This was of a pale colour, and looked like dirty tallow

Microscopically the liver, spleen, and kidney, especially as regards haemosiderosis, resembled previous cases Here, however, the marrow was of a very fatty aplastic nature, there being very little evidence of any haematopoietic activity, and it was greatly reduced in quantity owing to the bone sclerosis

The cord in the dorsal and lumbar regions was more markedly involved than in the previous cases The same columns as previously were affected with the degenerative process Fig 1 shows the condition in the lumbar enlargement, degeneration being especially noticeable in the posterior columns

CASE IV

Hen 121 White Leghorn, 1 year old, unable to walk When it tries to do so it tumbles over on to its side *Haemoglobin is* 70 per cent, while the blood films show nothing abnormal The conditions found post mortem were as usual The omentum, however, contained a great quantity of fat, the fowl was not emaciated The marrow in the femur and tibia was of a pale grey colour, and quite abnormal

Microscopically the appearances in the liver, spleen, and kidney, especially as regards haemosiderosis, were as in previous cases The marrow was aplastic and fatty, and showed very little active haematopoiesis Very marked degenerative changes similar to those already described were found in the dorsal and lumbar regions of the cord

CASE V

Hen 122 White Leghorn, 1 year old, showed considerable weakness in the legs, but not so marked as some of the others Haemoglobin was 60 per cent, while the blood films showed nothing markedly abnormal Post mortem the usual conditions were found, including the milk-chocolate coloured liver There was great emaciation The marrow in the femur and tibia was crimson and very fluid, resembling thin red-currant jelly

Microscopically the liver, spleen, and kidney were as usual, the haemosiderotic condition being marked, The marrow showed great congestion of numerous blood sinuses, which had replaced the usual fat cells and functioning marrow tissue The changes in the dorsal and lumbar cord were as in hen 121, only not so marked

CASE VI

Hen 223 White Leghorn, 1 year old, paralysed and unable to stand The haemoglobin was 40 per cent, while the red blood cells numbered 845,000 per c mm Blood films showed marked erythroblastic changes

Post mortem the conditions found were as in previous cases This hen, however, was not emaciated By this time one had come to appreciate the importance of the duodenum in relation to the excretion of iron in primary anaemia,[2] and the duodenal mucosa in this case was found to be deep rusty brown in colour The femur and tibia were very markedly sclerosed, while the greatly diminished marrow was quite abnormal in appearance, being of a pale grey colour

Microscopically the appearances in the liver, spleen, and kidney were as in the previous cases, including the haemosiderosis The duodenal villi showed considerable iron pigment in their cores The marrow was very definitely aplastic The dorsal and lumbar cord showed the usual lesions

CASE VII

Hen 360 White Leghorn, 2 years old, can walk about and even run, but every now and then, without warning, it falls backwards and sits down It lies in the house all day, and does not mingle with the other hens in the run The haemoglobin was 70 per cent, and red blood cell count 2,100,000 per c mm Blood films showed nothing markedly abnormal

The conditions found post mortem were as usual, including the typical liver appearances The mucosa of the duodenum was slightly less brown than in hen 223 The femur and tibia showed

great sclerosis and the marrow was considerably diminished in quantity It was of a reddish colour

Microscopically the appearances in the liver spleen and kidney were as usual including the haemosiderosis The marrow showed absence of fat cells and great increase in number and distension of the venous sinuses with consequent diminution of the haematopoietic tissue Sections of the lumbar and dorsal cord showed very marked degeneration in the usual situations The condition present in the dorsal cord is shown in Fig. 2

The important findings derived from these observations may be summarized In a series of fowls, lesions of the cord, indistinguishable from those described as occurring in subacute combined degeneration of the cord in human beings, have been found In all the cases this has been associated with the existence of a high degree of haemosiderosis of the liver, spleen and kidney, and also of the mucosa of the duodenum, where this was examined In three cases there was also very marked sclerosis of the bones with great diminution in the quantity and marked change in the appearance of the marrow The marrow, when examined microscopically, has been found to be abnormal in all the cases In some it showed atrophy or aplasia, in others considerable diminution accompanied by great increase and distension of the venous sinuses while in others it showed a haemocytoblastic hypertrophy such as one finds typically in active pernicious anaemia of the fowl In some of the cases there was comparatively little alteration in the circulating blood In one case, however, there was considerable reduction in the haemoglobin percentage and number of red blood cells while in others there was evidence of blood instability, as shown by the presence of erythroblasts

Attention may also be drawn to a further circumstance It will be seen that most of the cases in the present series are in young fowls of about a year old Further, that in the older cases sclerosis of the bones becomes a more marked feature These occurrences are exactly paralleled by what takes place in the pure primary anaemia of the fowl without nervous complications This circumstance suggests the essential identity of the two conditions

The significance of the occurrence of the paralytic symptoms in fowls, the circulating blood of which seemed in most cases to be fairly normal for the time being, requires discussion at the outset In the routine of the poultry industry a fowl is rarely noticed to be anaemic or to have a yellowish comb until the haemoglobin has fallen to about 35 per cent * It may be mentioned, however, that yellowness of the comb is not a function of the haemoglobin content of the blood alone It is determined also by the strength of the circulation which, even if the blood has a low haemoglobin content may suffice to keep the cavernous sinuses of the comb sufficiently full of blood to hide the normal yellow coloration of the tissues due to carotene or xanthophyll,† and thus produce a reddish coloration There is room, obviously, for exceptions to the above rule, which, however, is not submitted as being infallible

In general, therefore, in fowls, there occurs a zone of haemoglobin deficiency between 70 per cent (normal) and 35 per cent, within the limits of which the fowl may not be discovered in practice to be ailing at all, or specifically to be suffering from an anaemia For long periods, therefore, with relapse and remission, it is possible that fowls may be affected with a severe anaemia without this being appreciated In the present series, for instance in the majority of the cases there was no history of previous illness or of the occurrence of anaemia Another aspect of the same subject is the fact that in routine practice fowls with anaemia of gravity indicated by 20 per cent haemoglobin and 400,000 red blood cells per c.mm may be regarded as having been *just* taken ill, when further examination shows them to have very old standing disease in a relapse stage after a long remission

That in the paralysed fowls of this series there has been an anaemia associated with haemosiderosis is proved, and that it has been of comparatively long duration is shown by the state of the marrow and the advanced sclerosis of the bones How the circulating blood happens to be normal, more or less, when these cases are first observed, and what bearing these points have on an understanding of the human disease will be discussed shortly

Before going on to the general discussion the ground may be further cleared by referring to some points which apparently axiomatic are nevertheless liable to be overlooked An organ or tissue may be damaged, so far as the influence on it of its blood supply is concerned, either from normal blood being supplied to it in insufficient quantity (owing, perhaps, to the supply vessels being constricted or to the blood pressure being low), or from blood abnormal in cell and haemoglobin content being supplied in the normal quantity or even in deficient quantity owing to weakness of the heart and low blood pressure—occurrences very common in anaemic conditions These considerations have an important bearing on an understanding of the changes occurring in certain organs—for example, the nervous system stomach, etc—as will be discussed later on

Collier,[2] in dealing with subacute combined degeneration of the spinal cord, mentions as a "common designation for the condition "the anaemic spinal disease" This in itself will serve to show how closely this disease has been associated in some minds with anaemia He states, further, that the early writers believed that the anaemia was the essential part of the disease, and that the degenerations in the nervous system were the result of vascular changes* consequent on the anaemia He goes on to mention that this view is negatived by the fact that some cases progress to a fatal issue without any evidence of anaemia As has just been pointed out however anoxaemia of a part may be due to lack of blood as a whole rather than to a deficit of haemoglobin and red blood cells in the blood In this regard it may be mentioned that Kattwinkle (quoted by Collier) considers that the primary spots of degeneration in the cord in this disease are determined by the vascular distribution, and that they result from disease of the perivascular lymphatics Again Osler and McCrae,[3] while arguing for a toxic origin of the disease point out that the action of the toxin on the nervous system affects first as one would expect, those tracts whose mere length must necessitate a more elaborate nutrition for their maintenance It is obvious that the long tracts would be at least equally liable to damage owing to the difficulties of blood supply especially in conditions of anaemia, where not only is the blood poor in quality but the quantity deficient owing to the weakness of the heart and the lowered blood pressure

It may be that the cases of subacute combined degeneration of the cord associated with pernicious anaemia do not constitute *all* the possible cases of this disease There may be others due to mechanical anoxaemia, and these might theoretically constitute the cases referred to by Collier as being unassociated with anaemia Another more likely possibility will be discussed immediately

Following his original argument Collier proceeds to state, as evidence against an anaemic causation that in other cases the nervous manifestations may become severe long before any anaemia is present The possibility that anaemia of sufficient degree to be damaging may have been present previously but unobserved in such cases is not discussed Such a contingency we have shown cannot be overlooked in fowls Parallel events moreover occur in pernicious anaemia in human beings Naegeli Gulland and Goodall,[4] Davidson and Gulland,[5] and others have drawn particular attention to the characteristic fact that persons with pernicious anaemia have an amount of vigour and capacity for work quite out of all proportion to the degree of anaemia they are suffering from It is obvious that such persons would not seek advice till the disease was well advanced Again, in very many cases patients suffering from pernicious anaemia present them-

Observations made on a considerable number of "healthy" hens which showed no outward signs of anaemia have disclosed in several cases not only haemoglobin and red blood cell deficit, but more important from the point of view of the present discussion marked haemosiderosis and considerable marrow changes.

† Yellowness of the comb and other body tissues especially the fat is a very frequent occurrence in primary anaemia. This is not due to bilirubin, but to carotenoid pigments which are unoxidized and so accumulate (vide Bunnell *Brit. Med.* 1930, January 25th p. 165 also Bedson and Knight *Journ. Path. and Bact.* 1924 27 p. 233).

* Vascular changes as distinct from oligochromocythaemia and oligocythaemia as discussed later in this connexion.

selves for examination, not for anaemia or its immediate results, but for some minor complication such as ulcers of the tongue, etc. It does not seem too much to suppose, therefore, that degrees of anaemia—short of a certain limiting but surprisingly low threshold value—may, when unaccompanied by complications which cause the patient to seek advice, have been present for long periods unobserved in the cases one is dealing with here. This is all the more likely when one considers the remissive nature of the disease and the fact that the earlier attacks are less severe than the later ones, and become gradually worse.

In his argument against anaemia being the essential cause of the disease, Collier further states that no case has been recorded or has occurred in the large series examined by himself in which the nervous manifestations developed in a patient already under observation for anaemia. Davidson and Gulland take exception to this statement in its absolute form, but, even if it is not strictly true as it stands, it nevertheless emphasises an important phase, which has its parallel in the disease in fowls. Of the many fowls which had frank anaemia at the time the birds first came under observation, not one subsequently developed nervous symptoms, although many were kept under observation for very long periods, having regard to the age to which a fowl normally lives.

Such an occurrence, however, does not necessarily bear the interpretation which Collier puts on it. It may be that all the cases liable to be affected with nervous symptoms in the course of the disease are affected once and for all in the early stages, possibly because *adaptation* of the nervous system to the changed blood supply, rapid in the majority of instances, is slow in such cases. These, moreover, would constitute the cases, already referred to, where anaemia is not prominent at the time the patients come under observation. It seems likely that the enforced rest, due to the paralysis, has been effective in rendering the anaemia unobservable. Davidson and Gulland and others have stressed the *great importance* of rest as a therapeutic measure in bringing about remissions of anaemia and preventing relapses. It seems likely that in cases not prostrated by the initial attack there is gradual accommodation to the new conditions of the blood and its circulation, and the nervous system becomes so adjusted to the altered environment as to be immune more or less to the subsequent *onset of the nervous complications*.

The idea underlying the explanation suggested here is that the central nervous system can accommodate itself to a condition of anoxaemia just as it can to high barometric pressure and subsequent decompression, if in all cases the changed conditions are imposed gradually. In both sets of circumstances, however, a certain proportion of cases suffer.

Observers are not unanimous about the percentage incidence of nervous sequelae in pernicious anaemia cases. Thus Woltmann (quoted by Piney[3]) states that neurological symptoms occur in over 80 per cent. of the cases, and histological lesions of the spinal cord in a slightly greater percentage. Davidson and Gulland maintain that only 5 per cent. of the anaemic cases show definite evidence of cord damage. The nervous symptoms present in the other 75 per cent. of the cases, they state, are those that occur in any severe anaemia, and are due solely to the anaemia and cardiac weakness.

The pathological changes present in the spinal cord in this disease are minutely described by Collier. The essential lesion is a degeneration of the nerve fibres of various columns, but *without any neurological proliferation* to produce sclerosis and shrinkage of the cord. This characteristic absence of neuroglial proliferation must be emphasized. Piney says in this connexion that it is difficult to imagine that lesions which cause no reaction on the part of the adjacent tissues can be inflammatory in nature, and if one postulates the action of a toxin, the difficulties, he states, are perhaps even greater. Other writers have felt the same difficulty in explaining the absence of reaction *on the part of the surrounding tissues*. Piney attempts a solution in a manner with which I am unable to agree. He suggests that the characters of the changes give the impression that they are due to "abiotrophy" in the sense of the word as used by Gowers—namely, the possession of a variety of hereditary constitutional weakness of the tissue.

The latest authors subscribing to the view that patients with *pernicious anaemia have an hereditary constitutional weakness or diathesis* are Davidson and Gulland. Their argument is that occasionally several cases of pernicious anaemia have occurred in the same family or in near relatives, which suggests the existence of a constitution predisposing to the disease. Davidson and Gulland themselves calculate that pernicious anaemia occurs to the extent of one case in twenty thousand of the general population, this being deduced from the fact that the mortality rate for the disease is 3 to 6 per 100,000 of the population. It follows that from the time pernicious anaemia was recognized and written about as a disease entity hundreds of thousands of cases must have occurred. Nevertheless, out of this total, at a generous estimate, only a few hundred individual cases have shown a familial relationship. These cases would appear to be the exceptions, and it seems likely that an explanation of their occurrence would be found along the line of similar habits, similar environment, exposure to similar producing causes, whatever these may be, or, indeed, even in terms of mere chance occurrence. A similar conclusion has been drawn from the facts that in *Bothriocephalus latus* anaemia a similar familial relationship has been discovered, that a few only of the harbourers of the parasite develop the anaemia, and also that an individual may suffer from a bothriocephalus anaemia, be cured of this by the expulsion of the parasite, and later on develop a true idiopathic pernicious anaemia.* It is difficult to see how such a conclusion could be drawn from such premisses. Disease results from the interaction of two factors, an exciting cause, and a susceptible organism on which the cause acts. Disease may appear not only in a weakened or predisposed organism—and many factors other than heredity may produce such weakness or predisposition—but in an organism subjected to more than usually virulent exciting causes. Again, as is suggested in the foot-note, the so-called idiopathic cases, which develop later, may be the direct result of the original bothriocephalus infection.

A diathesis has also been alleged to exist with regard to the appearance of disease phenomena in individual organs, such as the nervous system, the stomach, the liver, and the bone marrow (*vide* Davidson and Gulland). Allusion has already been made to Piney's statement about the part played by "abiotrophy," an inherited tendency, in the production of the nervous phenomena. Similarly, Davidson and Gulland state that the constitutional factor is found at its greatest in the central nervous system, and is generally accepted as the essential cause of the familial hereditary ataxias. But the familial hereditary ataxias are characterized by marked neuroglial proliferation and sclerosis of the cord, a condition that is characteristically lacking in pernicious anaemia. Collier, who has had an unrivalled experience of cases of subacute combined degeneration of the cord in all its forms, states categorically that heredity is not a factor in the occurrence of the disease.

Viewing the question generally, it can be said with justice that if hereditary predisposition is held responsible for lesions of the nervous system (and other systems and organs) in this disease, then it can logically be held responsible for the sequelae and complications of each and every individual disease in which complications and sequelae are irregular in their occurrence. Those cases having them would, on this basis, possess an hereditary constitutional predisposition to them of the particular organ or system affected, and *vice versa*.

In my view the nervous complications are in all likelihood the consequences of the anoxaemic condition characteristic of the disease. This conception explains the absence of the neuroglial proliferation and sclerosis of the cord, and it accounts for the site of election of the cord lesions—namely, in long tracts of the lower dorsal region, with their nutritional disabilities and difficult blood supply.

Many writers believe that achlorhydria of the stomach is an essential component of the symptom complex of

*Evidence is accumulating that in the fowl the anaemia may persist and cause death long after the tapeworms which originated it have disappeared from the body. This would indicate that the tapeworms have set up a condition which subsequently can develop independently

pernicious anaemia Some even maintain that this organ has an hereditary constitutional predisposition to the disease (Davidson and Gulland) In the first place, they allege that achlorhydria is a constant in pernicious anaemia, and that in a few cases there has been evidence of achlorhydria years before the patient developed pernicious anaemia, secondly, that relatives of pernicious anaemia patients are more prone to achlorhydria than individuals in the general population and that these same phenomena have been observed in regard to bothriocephalus anaemia On the other hand, however, it is indisputable that cases of pernicious anaemia occur with quite normal gastric secretions (Davidson and Gulland), that achlorhydria occurs also in ordinary secondary anaemias, that it occurs in many normal individuals and in many so-called acquired achlorhydric patients (Davidson and Gulland), about whom there is no evidence of greater liability to pernicious anaemia than in the general population

Moreover, other explanations of the achlorhydria are more in keeping with the facts Elsewhere[9] I have adduced evidence to show that the condition is a sequel to the anoxaemia of the central disease I showed that in anaemic pigs there was a considerable lowering of the alkali reserve of the blood, and that in the cases so far examined, this was accompanied by an entire absence of acidity of the gastric contents Having regard to the respiratory difficulties in conditions of anaemia and the importance of the "chloride shift" in respiration, these facts suggested that the achlorhydria was a direct result of the blood condition Such a view is supported by work carried out with histamine Thus, Katzenelbogen[10] has shown that the injection of histamine causes a simultaneous rise of the alkali reserve and a secretion of acid gastric juice into the stomach, a combined result which cannot be without significance in the present issue Bennet and Dodds's results from gastric analysis and estimation of the alveolar carbon dioxide tension point in the same direction [11]

Apart from these considerations, the actual anoxaemia will make it difficult for the stomach to carry out its function properly When a remission has been produced in pernicious anaemia, say, by liver extract, the stomach has been said never again to secrete free hydrochloric acid (Davidson and Gulland) Vaughan[12] does not agree with this view, but even if it is correct it seems capable of a simple explanation along lines already indicated The achlorhydria would at first be functional Its persistence, however, over long periods would lead to bacterial infection of the stomach and this, together with the anoxaemia, especially in the debilitated state of the body due to the anaemia, would result in the production of organic changes in the mucosa which would render the condition permanent Such organic changes have, indeed been described as present in every case by Faber and Bloch (Davidson and Gulland)

I shall now consider the part possibly played by the liver in the disease In a prolonged discussion of the cause of megaloblastic formation in pernicious anaemia, Davidson and Gulland after having practically dismissed the views of Pepper, Cohnheim, and Ehrlich that the megaloblastic change occurs as the result of an inborn error or constitutional defect in the marrow or of a toxin acting on the marrow (the latter on the grounds that no such toxin has ever been demonstrated) proceed to state that both these theories take a very subsidiary place to the one which they now propose to expound * They believe that there exists in the body, principally in the liver, but also in the kidneys and to a less extent in certain other structures, a substance whose presence in sufficient concentration is essential for normal blood formation A deficiency of this unknown but specific factor causes a megaloblastic anaemia In spite of their recognition, by implication if not by actual statement, that this factor occurs in tissues other than those of the liver, they show nevertheless that they regard the condition as one of deficiency of the liver, and of the liver only,* in regard to this specific factor Clearly on their own submissions, the kidney and other organs are equally involved

One may, however, adduce reasons for believing that the liver is the organ mainly at fault in regard to the actual *supplying* of the factor Elsewhere[13] I have shown that in conditions of iron deficiency in pigs extirpation of practically the whole liver has a profound effect on cell multiplication in the marrow In such conditions the marrow is intrinsically sound, but the absence of the liver factor leads to the production of normoblasts by amitotic division of the megacaryocytes This, it should be noted is a cell division abnormality, and indicates an influence of the liver on cell growth In this connexion it should be emphasized that McCollum[14] has shown that liver and kidney have a marked effect on cell multiplication Further attention may be drawn to the fact that the marrow differs from most other tissues in the body, in that cell multiplication and ripening is its main function The others metabolize, store, and so forth but cell multiplication in them is more or less at a standstill These considerations may account for the practical absence of the liver factor in the marrow, where it is used up in cell multiplication, and for its presence in such quantities in, for example, the kidney where it is not used for this purpose and can therefore be stored There is thus considerable evidence for the view that the liver prepares a substance which has a marked influence in controlling the healthy marrow and it seems probable that this or some allied substance may have an equally profound effect on a marrow already diseased

Although I regard the liver as the factory where the agent is produced, I do not assume disease of the liver to be the essential primary cause of pernicious anaemia In my view[15] the liver is healthy at the beginning of the disease but later on a vicious circle may set in and owing to ever-increasing anoxaemia, the liver becomes more and more disabled The marrow is, I believe, the primary seat of the disease Under ordinary conditions one may suppose that the healthy liver produces sufficient liver agent to keep the healthy marrow under control and prevent the formation of embryonic cells Once, however, owing to the action of some irritant, the marrow becomes disordered the healthy liver can no longer produce enough agent to keep it in check a vicious circle is set up and the marrow proceeds with ever-increasing speed to complete disorganization It is only when the agent already supplied by the patient's liver (possibly still healthy and acting to its full extent) is supplemented by an agent from outside sources that a check is put on the process

Castle's[16] work may be reviewed in the light of what has just been said He found that when beef steak that had been previously digested in a normal person's stomach was given in suitable amounts to a person suffering from pernicious anaemia a typical reticulocyte response could be elicited, although the same amount of beef-steak itself, or of the digestive juices alone, or of beef-steak artificially digested in a test tube completely failed Castle's conclusion from these facts is that the patient's stomach lacks some factor which allows the active principle to be obtained from ordinary meat, and he believes the stomach to be the organ primarily at fault Against such a view is the fact that in a certain number of cases of pernicious anaemia gastric digestion is normal The phenomena can easily be explained by the supposition that owing to the digestive disabilities of the stomach, the liver is no longer receiving the raw materials from which it can elaborate the agent or principle

Pepper[17] and Cohnheim[18] held the opinion that the essence of pernicious anaemia was that the bone marrow had reverted to an embryonic type they considered that an embryological developmental or hereditary factor had sufficient "drive" in itself to produce the disease Later observers including Ehrlich [19] extended this view by suggesting that the changes in the marrow were due to the action of a toxin In many instances this toxin was regarded as being haemolytic Elsewhere[9] in connexion with this possibility, I have shown that the haemolysis, which gives rise to a haemosiderosis, is the result of the disease and not the cause of it Moreover haemolytic toxins produce a normoblastic or macroblastic condition of the marrow and blood, not a megaloblastic and megalocytic one

* It is to be inferred from their argument that they regard the liver as the primary seat of the disease. Peabody (*Amer. Journ. Path.*, 1927 iii, p 179) and others had already emphasized the importance of the liver

There would seem to be little doubt that a toxin or an allied substance acting on the marrow is at the root of the production of the disease Here, by its irritative or stimulating action, it produces a specific type of marrow change There is no evidence for the view that the lesions in the various organs in pernicious anaemia are produced directly by the same toxin or by a variety of different toxins Everything suggests that the conditions in the nervous system, stomach, and liver (in the later stages) are produced secondarily by the anoxaemic state brought about by the primary marrow lesion Any other view would seem to be incapable of explaining how such diverse causes as those producing idiopathic pernicious anaemia, sprue, and the pernicious anaemia of pregnancy, syphilis, tapeworm infestation, malaria, etc, can so uniformly bring about what Vaughan calls these "oddly associated lesions"

Summary

The essential and primary factor in the production of pernicious anaemia is the involvement of the bone marrow in an irritative process, which causes it to revert to embryonic cell formation

The resulting anoxaemia causes, secondarily, the complications which are to be found in the central nervous system, the stomach, and the liver (later stages)

There is no evidence for the existence of a "pernicious anaemia diathesis" either in relation to the disease as a whole or to the organ complications

I wish to express my indebtedness to Mr Archibald Macdonald, M A, B Sc, for supplying the fowls, to Dr Marion B Richards and Mr Kenneth McKenzie, M Sc, for preparing the photographs, and to the Carnegie Trust for the Universities of Scotland for a grant towards their reproduction
